Symbiotic Psychology

“Not until the illusion of emotions is understood, will the power of emotions be revealed.”

Dear Health Care Professional:

Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness outlines a new paradigm of emotional understanding. Rather than demonizing emotions as aberrant, destructive, out-of-control and in need of regulation because of an emotional disorder, Symbiotic Psychology understands emotions as an evolved sensory system, akin to the sense of pain, giving conscious feedback of a state of physiological biochemistry. Emotions instead of being regulated by cognitive behavior are used to guide cognitive behavior for the health and well-being of the individual.
Do not fixate on the broken and mangled hand, for it is indeed a soreness to any beholder. The message is not within the hand, nor within the moon and stars at which it points but lies within another Universe that surrounds us – known only through its quiet revelations.
Symbiotic Psychology:
The Synergy Between

Mind,

Body,

Emotions,

and Consciousness

Symbiotic Psychology

Not until the illusion of emotions is understood,

will the power of emotions be revealed.
Forward

In the 1930’s John Fowlkes, Ph.D. and my grandparents, Lora Z. Jackson and Arnold S. Jackson, M.D., F.A.C.S. wrote The Healthy Life Series of books:

- Making Life Healthful
- Healthy Growing
- Healthy Bodies
- Healthy Living
- Keeping Well
- Success Through Health

Their “Forward to the Teacher” in these books reads in part as follows:

“It is generally agreed that one of the major functions of public schools lies in the field of health education. A sound program of health education should help boys and girls to establish and practice desirable health habits based upon recent scientific information.

A program of health education such as that just pictured requires texts material which will stimulate the interest of a child in his health, make him conscious of problems of public health, motivate the learning of important and valid facts, and guide the child in the utilization of such facts to maintain his own health and the health of his neighbor. The Healthy Life Series aims to present text material in health which meets the requirements just given.”

I believe our public schools must reinvestigate their mission of bringing health and well-being to their students and to the public in general. Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness represents a roadmap into a new generation of scientific knowledge, information, and understandings necessary for individuals to comprehend and to realize their own physical and mental health, well-being, and prosperity within their daily lives.

The greatness of the human life experience emerges from the flames of individual desire arising out of hell’s fiery conflicts on earth. Intention is forged in these fires. Emotional guidance aligns our journey with these new intentions. Each succeeding generation will have its own mountains to climb and waters to cross with their own stars to navigate towards. Intent is that guiding star; and it is our emotions that perceive its light. The more joyous the feeling, the more harmonious and powerful the wonders revealed through life’s journey.

together
Neuroplasticity

The neural networks that supported a reality and the cause of violent behavior yesterday, those same neural networks have the physical plasticity to change today and to no longer have the capacity to support that violent reality and behavior tomorrow.
Rather than demonizing emotions as aberrant, destructive, out-of-control and in need of regulation because of an emotional disorder, Symbiotic Psychology understands emotions as an evolved sensory system, akin to the sense of pain, giving conscious feedback of a state of biochemical physiology. Emotions, instead of being regulated by cognitive behavior, are used to guide cognitive behavior for the health, well-being, and prosperity of the individual.
The Emotional Paradigm:

The words used to discuss emotions (such as emotions, feelings, and more precisely, fear, anger, and joy) neuro-linguistically combine (1) the cognitive activities that precipitate biological changes/states, (2) consciousness's awareness of these biological changes/states, with (3) some combination of good and bad feeling awareness.

OR:

Cognition excites an emotional neurology that changes the body’s/brain’s biochemical physiology of which consciousness perceives as some combination of good and bad feeling emotions and feelings. These resultant emotions and feelings and their associated causal cognitive activities are linguistically combined into emotional cognitive constructs such as joy, excitement surprise, sadness, anger, fear, and contempt.

OR:

Cognition is causal to the effect emotion.
Any attempt to understand and affect the internal human environment must be taken with an understanding of the changing biochemical conditions of that environment as indicated by an evolved emotional neurocircuitry of the human body.
Symbiotic Psychology: Emotions and Feelings Are Nature’s Biofeedback Mechanism

Emotions and feelings are felt. Good and bad feeling emotions and feelings are the perception, by consciousness, of a biochemical physiology within the body and the brain precipitated by an evolved and nurtured cognitive neural circuitry. Because emotions and feelings are perceptions of an internal state of biology precipitated by cognition, emotions and feelings are a reflection of, and give insights into, the nature of said cognitive behavior. Also, because emotions and feelings are not causal, emotions and feelings are neither destructive nor constructive but rather they are indicators towards the presence of very real destructive and constructive – and causal – cognitive behaviors. Correlations between cognition, healthy biochemical physiology, and good feeling emotions and feelings are a result of millions of years of evolutionary survival for the health and well-being of the individual – as are the correlations between bad feeling emotions and feelings and an unhealthy biology. Now the question is, how are these correlations between cognition, biology, emotions and feelings, and consciousness understood, nurtured, and developed within a society for an individual’s health, wealth, and general well-being through their own successful decision-making and creativity?

Well-being and the success of any professional therapy, mental or physical, is not defined by the absence of illness but by the presence of health, vigor, and joy along with the necessary cognitive skills, abilities, and motivation to nurture these conditions by employing one’s own emotional guidance.
Defining Cognition as Causal to Neurological and Biological Changes in the Brain and Body and Emotions as the Effect of Said Same Changes

1) Are emotions causal to neurological and biological changes of the brain and body or a perceived effect of said same changes or both?
2) The mind neurolinguisticly creates an emotional cognitive construct combining cause and effect.
3) Defining emotions as the perception of neurological and biological changes within the brain and body precipitated by cognition.

Discussion:
Note: cognition deals with the processes of knowing and awareness, namely, perception, recognition, conceiving – which includes imagination and inspiration – and reasoning. (Encyclopedia Britannica, Cognition: thought process)

Emotions in Science, Religion, and Literature
Emotions are perceived in science, religion, and literature as potentially aberrant and destructive and in need of management and control, even with the use of pharmaceuticals because emotions are understood and defined as causal to neurological and biological changes that can have a great effect on driving behavior. Mind has neurolinguisticly combined (1) the cognitive activities of awareness, (2) the changes in the body’s/brain’s neurology and biology, (3) the feelings and perceptions of said same changes, and (4) the outward behavior into one cognitive construct called emotions. Within religion and literature this confusion only adds to the color of their dissertations, but within science, this muddle is unacceptable.

If emotions are causal to neurological and biological changes in the body and brain, then what term does a professor of psychological science use when discussing the good and bad feeling effects of said same changes that a person feels and perceives? The
Defining Cognition as Cause and Emotions as Effect

overwhelmingly commonly used and neurolinguistically programmed terminology is emotions. But then what of the perceived causal nature of emotions? Is it reasonable for psychology as a science to use the same terminology as both causal to biological change and the effect of said same biological change? This is not science. One word, emotions, cannot be defined as both the cause of neurological and biological change and the perceptual awareness of said same neurological and biological change.

**Defining Emotion as Effect**

Let’s retain the definition of emotions as an effect of neurological and biological changes in the body and brain that consciousness then feels or perceives. Emotions are then not defined as causal to these said same changes in neurology and biology. This runs counter to thousands of years of neurolinguistic programming of a cognitive construct that says emotions are causal to neurological and biological changes that drives behavior. Emotion terminology cannot be used as both the cause of neurological and biological changes and the perceived result, that is effect, of these said same changes. If emotions are not defined as causal, then what reasonable terminology can be used?

Neurological and biological changes of the body and brain that are felt emotionally cannot occur until the cognitive neurological processes of the brain are actualized. That is, there cannot be an emotional reaction to a hand being mutilated by a table saw until the event is – consciously or unconsciously – cognitively perceived, conceived, and understood. The cognitive processing of an event activates an emotional neurological network that precipitates any of a number of different combinations of neurological and biological changes that may then be perceived – depending upon one’s emotional acuity – by consciousness as a variety of good and bad feeling emotions. As such, emotions are the perception of neurological and biological changes precipitated by cognition.
Defining Cognition as Cause

Although not yet perceived as emotions, the neurological network that activates neurological and biological changes in the brain and body is sometimes referred to as the emotional brain or emotional neurology. This emotional neurology is not the perception of emotions but identifies the neurology involved as the actuator of neurological and biological changes in the brain and body that are then perceived as emotions. Since cognitive awareness and understanding of the mutilated hand in a table initiates these changes of the brain and body that are then perceived as a combination of emotions, cognition can be and is defined as causal and emotions are the perceived effect.

These definitions differ from today’s contemporary academic psychology in that emotions are not defined as causal to neurological and biological changes within the brain and body. Emotions are defined as the perceptual awareness of these said same changes precipitated by cognition. This is not a 3000-year-old neurolinguistic emotional construct as used in literature and religion. This is science. A person is not emotionally out of control, but cognitively out of control. A person being driven by anger, jealousy, or greed may be emotionally driven in a movie or book but in science, these neurological and biological induced states would be a product of cognitive activities. As such, emotions are the perception of neurological and biological changes precipitated by cognition. Cognition initiates or is causal to the changes in neurology and biology that is then perceived as good or bad feeling emotions. As such, emotions may be used as a natural emotional biofeedback mechanism and aid in guiding cognitive and physical behavior for the promotion of personal health, wealth, and well-being.

Managing Cognition with Emotional Guidance

Cognition is cause; emotion is effect. Cognition must be managed and controlled, not emotions, because aberrant and destructive cognitive behavior precipitates neurological
and biological changes within the brain and body that drive behavior. Emotions have evolved to guide cognitive activity for personal health, prosperity, and well-being. Literature and religion may not understand this, but science should.

My current and full presentation of these arguments may be found and downloaded on: https://emotional-evolution.com/ or https://symbioticpsychology.com/.

Passionately,

Andrew Jackson
2020-01-25

The “science” of emotional regulation kept me imprisoned in a living hell for nearly twenty years. The “logic” of cognitive regulation through emotional guidance set me free. Emotions and feelings have evolved as a fantastic and wonderful personal bio-feedback system where emotions work in a symbiotic harmony with mind, body, and consciousness for the health, wealth, and well-being of the individual.

Subject: The Symbiotic Relationship Between Cognition, Biology, Emotions, and Consciousness

Date: 2019-12-20

Dear Psychology and Internal Medicine Communities,

Emotions, one of the foundational pillars of psychological theory, are commonly conceived as aberrant and destructive forces which drive biological changes. This letter is an introduction to a new perspective which shows (1) this is a misconception of emotions and (2) a corrected representation of emotions reveals their evolved biological role in the maintenance of individual health and well-being.

I am writing to you because I believe there is an important connection between linguistics and current misrepresentations of the nature of cognition and emotions and their biology within modern psychological and psychiatric theory that also impacts the study and practice of internal medicine.

Linguistics of Shakespeare:

Have English speaking researchers’ core beliefs of emotions – which may have been linguistically molded from childhood through family interactions and in later years through reading literary works such as Dickens’s Great Expectations, Poe’s The Raven, and Austen’s Pride and Prejudice – impacted their current understanding and scientific research about emotions and cognition?

A shared cultural and linguistic development of core beliefs and conceptual understandings about emotions is required for young students to comprehend and follow the emotional twists and turns within these popular English literary works. As students mature and are introduced
to the more advanced works of William Shakespeare and others, comprehension is even
more dependent upon prior assimilation of cultural and linguistic paradigms. Conceptions
of emotions are further reinforced by the logic and reason applied in today’s scientific
literature, research, and discussions about emotions.

Emotions as Causal:
The development of emotional intrigue as found within the interplay of literary characters
aligns with the paradigm of emotions as expounded in today’s psychological theories. Many
literary plots are driven by the characters’ mismanagement of their emotions, or are even
controlled and driven by their emotions of the moment. According to current psychological
theory, destructive and aberrant emotions must be managed because of emotions’ causal
influence upon biology.

Emotions as Effect:
A person feels an emotion and feelings. A person perceives emotions and feelings. This
awareness is principle to the definition of emotions and feelings. As visual acuity is the
ability to discern letters or numbers at a given distance according to a fixed standard
(Wikipedia), emotional acuity is a person’s ability to be aware of and to discern biological
changes and states within the body and brain.

Feeling Emotions and Feelings:
Good feeling and bad feeling emotions have an evolved biological significance. Good
feeling emotions and feelings correlate with a healthy biology and negative feeling emotions
and feelings correlate with an unhealthy biology. Rather than evoke the research, I will
discuss the logic involved.

If good feeling emotions correlated with an unhealthy activity – such as not eating – the
body, if the feelings were followed, would die. Conversely, if bad feeling emotions
correlated with a healthy activity – such as breathing – the body, if the feelings were
followed, would not survive. Therefore, for the body to ultimately survive the evolutionary process, good feeling emotions must correlate with healthy biological activity and bad feeling emotions must correlate with unhealthy biological activity. This scenario is but an extreme example of any number of possibly scenarios that would correlate health and emotional/feeling states.

The same logic goes for cognitive activity. If a person is cold and hungry and cognitive activities on how to obtain or create food and shelter were to only continue the emotional pain and misery, would such creative thought necessary for survival continue? Therefore, thought and imagination that pivots cognition from the negative feeling problem to the positive feeling solution – or possible solution – is necessary for evolutionary survival.

From an evolutionary biological perspective, if it feels good, it is good. Therefore, cognitive activity – for societal and cultural ethical advancement – must learn how to reframe emotionally negative cognitive activity into “appropriate” emotional positive cognitive activity. We as individuals in a society must learn and educate on how to effectively use emotions to guide cognitive activity and give meaning to the song, “Ac-Cent-Tchu-Ate the Positive”.

The Linguistics of Emotions as Being Both Cause and Effect:

When Homer wrote the Iliad almost 3000 years ago, he firmly established a cognitive construct of emotion as a combination of cause (biological changes) and effect (perception of these biological changes). Conscious awareness became neuro-linguistically programmed to understand the emotional chain of events as a singularity called emotion. By combining an awareness of cognitive thoughts with an awareness of biological changes into the singular paradigm emotion, this emotional neuro-linguistic paradigm or cognitive construct is both its own cause and its own effect.
The Symbiotic Relationship Between Cognition, Biology, Emotions, and Consciousness

Emotions as being both cause and effect is problematic in scientific discussion. A distinction must be made: are we discussing emotions as causal or are we discussing emotions as effect?

Cognition as Cause, Emotions as Effect:
By combining causal cognitive thoughts that activates an emotional neurology precipitating a biological effect which consciousness perceives into the singular paradigm emotion, this emotional neuro-linguistic paradigm has emotions as both cause of an event and the effect of the same event it caused. Scientifically – and logically – this is unacceptable.

Sequential brain imaging correlating cognitive awareness, biological changes, and emotional awareness by consciousness would seem to be invaluable research here to validate a cognitive cause/emotional effect paradigm. But logically, a person cannot have an emotional response to something until he/she is cognitively aware of that something. And emotional feelings of an event entail an awareness of biological conditions of said event which also cannot occur until after there is an actual change in biology. Any biological changes cannot occur until after there has been some change in cognition. Thus logically, the sequential order is (1st) cognitive awareness, (2nd) biological change/state, and (3rd) emotional awareness.

Dashboard Analogy:
Emotions are akin to the check-engine-light on the dash of a car. The light signifies problems within the mechanical physiology of the engine. The light is not the cause of the problem. The light is not aberrant nor destructive, but has mechanically evolved to bring to conscious awareness any potential problems within the engine, that if left unresolved, will lead to mechanical breakdown and failure – akin to what is observed in the biology of depression and anxiety that leads to suicide. Are people also ignoring, covering up, or taping over an emotional check-engine-light that signals biological susceptibility to illness, disease, and cancer?
The “check engine” light on the dash of a car is not causal but an effect. The issue is within the engine not the light. The light is the messenger informing the operator – if remedial action is not taken – of potential engine damage because of existing physical conditions. The light is not destructive and does not need control, management, nor regulation. The light provides an invaluable service for the health and well-being of the engine. To ignore the light or to take action upon the light, that is, to control, manage, or regulate the light itself would be detrimental to the survival of the engine.

The Illusion of Emotions as Aberrant and Destructive:

Because the cognitive construct of emotions has been neurolinguistic programmed to include cognition, biological changes/states, and the perception of these changes/states, emotions can be deemed aberrant and destructive. But an emotional reaction to a hand being mutilated in a table saw cannot not even be had if the cognitive events of perception and conception were not first actualized. That is, there aren’t emotional reactions to yet-to-exist events, real or imaginary (unless you are studying precognition).

Because cognition is causal to activating the emotional neurology that precipitates biological changes in which consciousness perceives and conceives as emotion, cognition can be aberrant and destructive, not emotions. Emotions are an effect. Cognition is cause.

Summary:

Because mental sciences’ definition and use of emotions is an extension of a 3000-year-old linguistic paradigm as defined in Homer’s Iliad, is it now possible to comprehend that emotions are but one part of a mind, body, emotion, consciousness symbiotic relationship, all working together for the promotion of physical and mental well-being? This realization is already innately understood by the healthy, wealthy, and wise. This reality must be part of all levels of education to improve the lives of the sick and impoverished and to break the generational chain of pain, suffering, and traumatic heritage onto the next.
Emotions from a scientific point of view – not from the literary paradigm we have learned from birth – cannot be destructive nor aberrant because they are not causal. Emotions are the effect of cognitive causal activity. It is cognitive activity that can be destructive and aberrant. Emotions are but a reflection of that activity. And most important, emotions can be used to understand, guide, reframe, and refine that emotionally negative cognitive activity into emotionally positive activity. It becomes behooving upon society to educate and train its citizenry of the nature of emotions and how to effectively use emotions towards one’s own health, well-being, and prosperity as well as for the health, well-being, and prosperity of the culture/society in which they live. Symbiotic Psychology was written to begin this transition from emotional self-indulgence reinforcing psychotic cognitive activity to emotional self-awareness and cognitive transformation guiding behavior towards health, wealth, and well-being.

My Appeal:
What value are evidence-based practices (EBP) in psychological and pharmaceutical therapies going to be for:

- the 47,000 people who are going to kill themselves in the USA next year? (AFSP, Suicide Statistics).
- our children who are going to be shot in the next mass shooting?
- the over 9,000,000 people globally who are going to die of cancer next year? (WHO, Cancer, Key Facts)
- the over two million people locked within USA’s judicial system (Wikipedia, Incarceration Rates) that cares more about the due process of punishment than understand that the brain’s neuro-plastic ability can change a personal reality of violence into a personal reality of well-being.

Where is the research to understand consciousness’s ability to use emotional awareness of feeling good or feeling bad as biofeedback to guide cognitive activity and to create a biology of health, prosperity, and well-being?
Emotions cannot be used to guide cognition as long as emotions are deemed aberrant and destructive because emotions are erroneously understood as changing biology. There is an emotional neurology that is activated by cognitive activities and this emotional brain does change and maintain a biochemical physiology but this causal emotional biology is not the conscious perception of emotional awareness called emotions.

This letter is my appeal for your understanding. I have done my best to outline the problem of modern psychological theory of emotions. I cannot change the embedded cognitive constructs of emotions within academia, but you can.

Passionately,

Andrew Jackson
M.S. Technology Education
M.S. Management Technology

It was not the science of emotional regulation within psychological and pharmaceutical therapies that freed me from the torturous and traumatic brutality of nearly twenty years of psychotic mania and suicidal depression, but the logic and wisdom of cognitive regulation through emotional guidance within psychological and pharmaceutical therapies.
To: Neuroimaging Researchers

Date: 2019-11-26

Note:
My life within psychotic mania and suicidal depression as a tech ed teacher, quality manager, and mechanical engineer and not a PhD psychologist have given me a unique "outside the box" perspective of psychological emotional theory that I have found nowhere else.

Subjects:
1. Can neuroimaging establish the cause/effect relationships between cognition, biology, emotions/feelings, and conscious awareness?
2. By establishing cause/effect relationships, can emotional terminology be standardized among psychological and linguistic academia?
3. What is the evolutionary significance of a conscious awareness of feeling good emotions/feelings or feeling bad emotions/feelings?
4. What is the significant difference between emotions and feelings when both are an awareness of biological states/changes neuro-linguistically combined with an associative cognitive awareness?
5. Is the nature of neuro-linguistic programming in defining the cognitive construct of emotions and its terminology so engrained from birth that science is automatically and without question accepting a linguistic construct of emotions that originated over 3000 years ago as exhibited in Homer’s Iliad?
Can a person’s neuro-linguistic programming and conception of its cognitive construct of emotions and emotion’s detailed variants such as anger, fear, happiness, and surprise contemplate an alternative paradigm contrary to his/her original basic beliefs?

Dear Professors,

“So, here is the situation. I could understand reasonably well how different emotions were induced in the brain and played out in the theater of the body. I could also envision how both the induction of emotions and the consequent bodily changes that largely constitute emotions an emotional state were signaled in several brain structures appropriate to map such changes, thus constituting the substrate for feeling an emotion. But, for the life of me, I could not understand how that brain substrate of feeling could become known to the organism having the emotion.”

I apologize if I have mis-understood his thesis. I will paraphrase:

He has 1st) “emotions induced in the brain”, 2nd) “consequent bodily changes” and 3rd) “feeling could become known to the organism having the emotion.” He has defined emotions as causal to the biological changes that a person then feels as emotions. This suggests to me that emotions are both cause and effect.

This is a problem. A person cannot have an emotional reaction to a snake unless there first are the cognitive activities of perceiving a snake, understanding that it is a snake, and the realization that the snake can be harmful. Only after these cognitive activities actuate an emotional neurology can there be biological changes. Actuating an
emotional neurology is not an emotion until these biological states are perceived,
understood, and realized as an emotion. I realize that a snake can also be causal to a
reflexive action, but even here, the reflexive action cannot occur until there is first the
cognitive perception – or cognitive imagination – of the snake.

Within the *Handbook of Emotion Regulation* (Gross J., 2014) discussion of the sequence of
“situation – attention – appraisal – response,” suggests that *situation, attention, and
appraisal* are causal to the effect *response*. But what are the cause/effect relationships within
this emotional *response*, that is, between the “experiential, behavioral, and neurobiological
response systems?” Professor Gross’ views about cause and effect are unclear.

The same lack of clarity arises within the all-encompassing cause/effect order within the
“environment” of “thoughts, physical reactions, moods, and behaviors” of *Mind over Mood*
(Greenberger, D., Padesky, C., 2016). This lack of a distinct cause/effect order lies in part,
or maybe because of, the commonly accepted cause/effect relationship as illustrated in
Cognitive Behavior Therapy: Basics and Beyond (Beck, J., 2011) where emotion is
characterized as causal to the effect physiological response.

Is it possible the terminology of emotions, like happiness, sadness, fear is but a neuro-
linguistic cognitive construct that combines the (1) awareness and perception of a
specific set of biological changes with the (2) awareness and perception of a specific set
of cognitive activities? And therefore, emotions such as happiness and fear are but an
illusionary placeholder, an imaginary variable implying causality to biological change.
Whereas the real cause of biological states/changes are the cognitive activities of
perception, recognition, conceiving – which includes imagination and inspiration – and
reasoning. (Note: cognition is as defined in Encyclopedia Britannica, Cognition:
thought process.)

I believe I understand Professor Damasio’s use and need for “emotional induction”. But why
even have “emotions induced in the brain” to initiate bodily changes? I prefer manipulating
a more common terminology such that (1\textsuperscript{st}) the neural circuitry of cognitive activities (2\textsuperscript{nd}) activate an “emotional neural network” that (3\textsuperscript{rd}) initiates biological changes. Then, more in keeping with common linguistic programming, these bodily changes can be (4\textsuperscript{th}) perceived by consciousness as emotions and feelings.

That is, a person feels, perceives, or is aware of emotions and feelings such that:

1) Emotions and feelings are the perception by consciousness of biological states and changes within the body/brain’s biology precipitated by cognitive activities through an “emotional neural circuitry”.

2) Or, simply, cognition changes the biology that consciousness then perceives as emotions/feelings.

Academic’s acceptance of the paradigm that “emotions” are causal to bodily changes is a major concern of mine and is the basis for some very problematic psychological and psychiatric therapy because “emotions” can be deemed aberrant, destructive, and out of control and causal to destructive and aberrant behaviors. And therefore, “emotions” must be controlled, managed, and regulated…. with pharmaceuticals if need be. This would harmonize with Professor Damasio’s terminology that “emotions induced in the brain initiate biological changes”. But…if what initiates biological change can be more clearly understood as cognitive activities activating an “emotional neurology” that initiates biological changes that consciousness then perceives as emotions, it is cognition that needs to be controlled, managed, and regulated. And by having cognition causal to biological changes, the success of cognitive behavior therapies (CBT) comes into a new light. And, the evolution of emotions can be understood as a necessary component of successful behavior and decision making.

I must introduce a new concept here that defines good feeling emotions and bad feeling emotions because within this understanding are the keys to transcending destructive
aggressive and abusive behavior. Good feeling and bad feeling emotions have a biological
significance. Good emotional feelings correlate with a healthy biology and negative
emotional feelings correlate with an unhealthy biology. I will explain.

If good feeling emotions correlated with an unhealthy activity – such as not eating – the
body, if the feelings were followed, would die. Conversely, if bad feeling emotions
correlated with a healthy activity – such as breathing – the body, if the feelings were
followed, would not survive. These scenarios are unreasonably extreme but this logic can be
applied to any of numerous more sensible psychological scenarios. Therefore, for the body to
survive the evolutionary process, good feeling emotions must correlate with healthy
biological activity and bad feeling emotions must correlate with unhealthy biological
activity.

The same logic goes for cognitive activity. If a person is cold and hungry and cognitive
activities of imagination on how to obtain or create food and shelter were to emotionally feel
painful and miserable, would such creative thought necessary for survival continue?
Remember that within the evolutionary process, any original outcome is possible but those
outcomes detrimental to survival tend not to survive.

From an individual biological perspective, if it feels good, it is good. An individual must
learn how to reframe emotionally negative cognitive activity into “appropriate” emotional
positive cognitive activity. Individuals must learn how to effectively use emotions to guide
cognitive activity. From a societal perspective, it behooves the culture/society to teach
individuals how their decisions towards their own health, prosperity, and well-being are
intertwined with society’s health, prosperity, and well-being.

Within humanity’s current neuro-linguistically programmed paradigm of emotions, emotions
must be controlled, managed, and regulated because destructive emotions drive aggression.
In my book, *Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and*
Consciousness, I develop a different paradigm where emotions and their attribute of feeling good or feeling bad have an evolved symbiotic relationship with the mind and body and emotions are used to guide one’s conscious choice of cognitive behaviors to promote health, prosperity, and well-being for the benefit of the individual as well as for his/her society and culture at large. (The latest revision of my book is freely available as a PDF download on: https://symbioticpsychology.com/ or https://emotional-evolution.com/)

The significance of this distinction between an adversary relationship with destructive emotions that must be controlled versus a symbiotic, synergistic relationship of emotional guidance is profound. Within the current linguistic usage of the word emotion and its more precise negative variants such as fear, anger, and hate, the human mind is continually being linguistically reprogrammed to shut off a biological feedback mechanism that, internally, protects the body and, externally, protects the culture and society one inhabits by promoting positive behavior. That is, for the survival and health of the individual, emotionally negative and destructive cognitive behaviors must be reframed into emotionally positive and constructive behaviors. This reconstituted negative, abusive, and adverse behavior into healthy and constructive behavior will then extend culturally outward and reshape society.

I realize that a researcher’s life’s work may prevent some significant resonance between definitions within academia but I am finding everybody in academia has a life’s work into their own working paradigms that is preventing some very important discussion and communication and, therefore, some very serious issues within psychological and psychiatric therapies are not being addressed.

I welcome any thoughts any researcher may have and since I am retired – from mechanical engineering – I am generally free for any discussions.

Somewhere, sometime, somehow, academia must find some common ground. Since I began voicing my concerns over psychological and pharmaceutical therapeutic methodologies erroneously based within causal aberrant and destructive emotions, over a million
A Neuroimaging Cause/Effect Standard Definition of Emotions?

(MILLION) Americans have committed suicide, millions of other people have been put in incarcerating conditions that only amplify their psychological injuries, and mass shootings continue with no review of the psychological environments that are oblivious to emotions’ evolutionary design and that are fostering all of these atrocities. Lack of true academic questioning and review of psychological and pharmaceutical emotional theory is a true crime against humanity.

Passionately,

Andrew Jackson

**Emotions and Feelings: Nature’s Biofeedback Mechanism**

*Emotions and feelings are felt. Good and bad feeling emotions and feelings are the perception, by consciousness, of a biochemical physiology within the body and the brain precipitated by an evolved and nurtured cognitive neural circuitry. Because emotions and feelings are perceptions of an internal state of biology precipitated by cognition, emotions and feelings are a reflection of, and give insights into, the nature of said cognitive behavior.*

*Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness (rev2020-01-23a)*
Also, because emotions and feelings are not causal, emotions and feelings are neither destructive nor constructive but rather they are indicators towards the presence of very real destructive and constructive – and causal – cognitive behaviors. Correlations between cognition, healthy biochemical physiology, and good feeling emotions and feelings are a result of millions of years of evolutionary survival for the health and well-being of the individual – as are the correlations between bad feeling emotions and feelings and an unhealthy biology. Now the question is, how are these correlations between cognition, biology, emotions and feelings, and consciousness understood, nurtured, and developed within a society for an individual’s health, wealth, and general well-being through their own successful decision-making and creativity?
To: Human Rights Activists

Subject: Linguistics of Emotions Subverting Human Rights

Date: 2019-11-13

Note: Maybe this is more appropriate for a class discussion, but I believe my arguments and grievances are worthy of the courts. In some aspects, my arguments are very simple, in other aspects, not so. I will do my best to explain.

Discussion:

My grievance revolves around the neurolinguistic understandings of the word “emotion” as misused within the world wide scientific and academic communities of psychology and psychiatry and ultimately in law and the courts. This human rights subversion is not easily communicated because “everyone” has been neuro-linguistically programed from birth with the common emotional paradigm that destructive emotions such as anger, fear, revenge, and hate are a driving force behind human behavior. This linguistic paradigm is only further engrained as a person continues their education into more advanced and complicated literary understandings. But the meaning and understanding of emotions as used in science, literature, and law is incorrect and the consequences of this misuse are devastating to individuals and their cultures.

Emotions such as fear, anger, hate, and revenge are commonly conceived as being aberrant and destructive. This injurious nature of emotions was outlined 3000 years ago by Homer in the Iliad. This is an erroneous understanding of how emotions have evolved for the health, well-being, and prosperity of an individual. The implications of destructive and aberrant emotions are that emotions are causal to an effect – that destructive emotions are the driving
force behind the atrocities you yourself have witnessed and litigated against in the courts.

They are not; emotions are not causal.

Emotions are not causal to behavior. Emotions are an effect of potentially very destructive cognitive behavior. It is cognitive behavior that changes a person’s biology that drives a person and culture towards insane behaviors, not emotions. Emotions are but the consciousnesses perception of these biological changes that are precipitated by cognitive activities. Cognition is causal to the effect emotion.

The analogy is the “check engine light” on the dash of a car. Consciousness perceives the “light” as an indicator of something amiss in the engine. The light is not destructive, nor aberrant, nor causal. The light indicates that something is going wrong within the engine and if ignored, or unattended to, there will be damaging failures within the engine. The light is an effect. The internal behaviors within the engine are the cause. Emotions are an effect. Cognitive behaviors, not emotional behaviors, are causal to the potentially destructive biological conditions within the body that drive the insane and abusive behaviors we are witnessing around the world.

I must introduce a new concept here that defines good feeling emotions and bad feeling emotions because within this understanding are the keys to transcending aggressive and abusive behavior. Good feeling and bad feeling emotions have a biological significance. Good emotional feelings correlate with a healthy biology and negative emotional feelings correlate with an unhealthy biology.

If good feeling emotions correlated with an unhealthy activity – such as not eating – the body, if the feelings were followed, would die. Conversely, if bad feeling emotions correlated with a healthy activity – such as breathing – the body, if the feelings were followed, would not survive. This logic can be applied to any of numerous cognitive/biological/emotional/consciousness-awareness scenarios. Therefore, for the body
to survive the evolutionary process, good feeling emotions must correlate with healthy
biological activity and bad feeling emotions must correlate with unhealthy biological activity.

The same logic goes for cognitive activity. If a person is cold and hungry and cognitive
activities on how to obtain or create food and shelter were to emotionally feel painful and
miserable, would such creative thought necessary for survival continue?

From a biological perspective, if it feels good, it is good. Therefore, cognitive activity – for
societal and cultural ethical advancement – must learn how to reframe emotionally negative
cognitive activity into “appropriate” emotional positive cognitive activity. We as individuals
in a society must learn how to effectively use emotions to guide cognitive activity.

Within humanity’s current neuro-linguistically programed paradigm of emotions, emotions
must be controlled, managed, and regulated because destructive emotions drive aggression.
Within this new paradigm, emotions have developed a symbiotic relationship with the mind
and body to promote health, prosperity, and well-being.

The significance of this distinction is profound. Within the current linguistic usage of the
word emotion and its more precise negative variants such as fear, anger, and hate, the human
mind is continually being linguistically reprogramed to shut off a biological feedback
mechanism that, internally, protects the body and, externally, protects the culture and society
one inhabits by promoting positive behavior. That is, for the survival and health of the
individual, emotionally negative and destructive cognitive behaviors must be reframed into
emotionally positive and constructive behaviors. This reconstituted negative, abusive, and
adverse behavior into healthy and constructive behavior will then extend culturally outward
and reshape society.

Note: for a more detailed argument and understanding of emotions as the perception of
biological changes caused by cognitive activities, see the attached files:
1. “Dear Scientific Community” (also found in the Symbiotic Psychology book)
   a. Subject: Can the world psychological/linguistic communities standardize the meaning of “emotion” within the cause/effect relationship between cognition, biology, emotion, and consciousness?

2. “PHAA”: Public Health Awareness Announcement (also found in the Symbiotic Psychology book)
   a. Subjects: Health Hazards of a 3000-year-old neuro-linguistic paradigm of emotions used as science.
   b. Cognition creates the biology that stimulates the emotional neurology consciousness then perceives.

3. “Symbiotic Psychology, The Book”
   a. Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness

Modern psychology’s emotional paradigm is but an extension of the erroneous linguistic emotional paradigm of emotions used in literature – including within religious texts as the Tora, Bible, and Koran. Current neuro-linguistic paradigm of emotions combines the causal understandings of biological changes with the emotional feelings’ and perception effect. Therefore, as currently used and defined, emotions are both its cause and its effect. When discussing and translating the word emotion and its more specific variants such as joy, fear, and hate, are these words being erroneously translated as causal to biological changes that drive destructive behavior or is the translation a more correct knowing of emotions as an effect of cognitive behavior that conveys the feelings and perceptions by consciousness of biological changes?

Continual misuse and erroneous international translations of the emotional paradigm itself is a causal factor towards the abusive and criminal behaviors against human rights. By the continual translation, use, and lack of recognition of a dysfunctional emotional paradigm, people are being denied an awareness towards their natural emotional heritage and ability to
transcend aggression, terrorist propaganda, and political mis-information. The mis-use of the emotional paradigm continues to support abusive behaviors against human rights.

Summary:

Emotions from a scientific point of view – not from the literary paradigm we have learned from birth – cannot be destructive nor aberrant because they are not causal. Emotions are the effect of causal cognitive activity. It is cognitive activity that can be destructive and aberrant. Emotions are but a reflection of that activity. And most important, emotions can be used to understand, guide, reframe, and refine that emotionally negative cognitive activity into emotionally positive cognitive activity. It becomes behooving upon society to educate and train its citizenry of the nature of emotions and how to effectively use emotions towards one’s own health, well-being, and prosperity as well as for the health, well-being, and prosperity of the culture/society in which they live.

What do you think? What does your class think? You are welcome to share my email to your class that they may respond. Will continual misuse of a word further the atrocities and abusive behavior by aggressors, despots, and terrorists around the world who thrive on the emotion’s current erroneous cause/effect dichotomy? Do words matter?

Sincerely,

Andrew Jackson

“UNSUBSCRIBE” is at the bottom of this email.

Date: rev2019-11-09a

Analogy:
The “check engine” light on the dash of a car is not causal but an effect. The issue is within the engine not the light. The light is the messenger informing the operator – if remedial action is not taken – of potential engine damage because of existing physical conditions. The light is not destructive and does not need control, management, nor regulation. The light provides an invaluable service for the health and well-being of the engine. To ignore the light or to take action upon the light, that is, to control, manage, or regulate the light itself would be detrimental to the survival of the engine.

Abstract:
1) Current use of the word “emotion” as used in science and literature lacks a clear cause/effect relationship between the cognitive activities, biological responses,
emotions, and consciousness awarenesses and even imply a meaning where
emotions are both cause and effect. There are efforts to remedy this conflict. (Beck,

a. If emotions are causal to the body/brain’s biological changes then emotions
can be destructive and in possible need of emotional management, control,
and regulation as currently developed in *cognitive* behavior therapies.

b. If cognition is causal to the body/brain’s biological changes and emotions are
the perception of this change, then cognition – not emotions – can be
destructive and in need of cognitive management, control, and regulation.

2) Sequential brain imaging correlated with cognitive awareness, biological changes,
and emotional awareness by consciousness would seem to be invaluable research
here. But logically, a person cannot have an emotional response to something until
he/she is cognitively aware of that something. And emotional feelings of an event
entail an awareness of biological conditions of said event which also cannot occur
until after there is an actual change in biology. Any biological changes cannot
occur until after there has been some change in cognition. Thus logically, the
sequential order is (1st) cognitive awareness, (2nd) biological change/state, and (3rd)
emotional awareness.

3) I propose the following definition:

a. Emotions are the perception of a biological state/changes precipitated by
cognitive activities.

b. In other words: cognitive activities precipitate brain/body biological
states/changes that consciousness then perceives as emotions.
c. These definitions can be further advanced to include the variety of neurological networks and bio-chemistry involved within the development of an emotional feeling perceived by consciousness.

d. Therefore: since cognition is causal to the effect emotion awareness, it is cognition, not emotions, that can be destructive and aberrant and in need of cognitive control, management, and regulation.

Discussion:
The current emotional paradigm – and the words used to discuss emotions (such as emotions, feelings, and more precisely, fear, anger, and joy) – neuro-linguistically combine the (a) conscious awareness of cognitive activities that precipitate biological changes/states and (b) consciousness's awareness of these biological changes/states. I would like to take the current concept of an emotion and divide it into its parts as a procession of events:

1st) Cognitive Awareness

a. Cognition deals with the processes of knowing and awareness, namely, perception, recognition, conceiving – which includes imagination and inspiration – and reasoning. (Encyclopedia Britannica, Cognition: thought process)

b. A person becomes aware of a snake. “A cobra appeared before him out of the brush. He recognizes the snake as a cobra and he understands the danger he is in.” (There is another possible reflexive reaction that I won’t go into here as well as the difference between imagination and reality.)

2nd) Biological Changes

a. This cognitive awareness precipitates a group of bio-chemical and neurological events and changes in the body and brain.

b. With our snake, this typically would be the flight-fright-or-freeze response.

3rd) Biological Awareness
A Standard Cause/Effect Definition of Emotions?

4th) Emotional Awareness/Emotional Event

a. From birth we have been linguistically taught the summation of the above
   one-through-three events or processes is an emotion.

b. Consciousness combines the cause (cognitive awarenesses) and effect
   (body changes) into one neuro-linguistic emotional paradigm of
   awareness. In this case, fear.

c. Different cognitive activities combined with different biological
   brain/body responses gives us the variety of emotions we perceive.

5th) Consequential Physical Behavior

a. Because a person’s behavior can be driven by this cognitive/body
   combination state of being called emotions, such driving emotions as
   anger, revenge, jealousy, greed, can readily be labeled destructive and
   aberrant. That is, emotions must be controlled and managed because of an
   emotional disorder. A person can be emotionally out of control.

From birth children have been taught that the summation of these events or processes is
an emotion. This neuro-linguistic paradigm of emotion is further reinforced as students learn
how to read. The more advanced the reading and studying, the more engrained is this
concept of emotions, as is the concept of destructive emotions driving behavior. Conscious
awareness has been neuro-linguistically programmed to understand these emotional chains of
events as a singularity called emotion. By combining causal cognitive thoughts with its
biological effect and creating the paradigm emotion, this emotional neuro-linguistic
paradigm is both its cause and its effect.

Emotions as being both cause and effect is problematic in scientific discussion. A
distinction must be made; are we discussing emotions as causal or are we discussing
emotions as effect?
Cognition as Causal: Emotional Awareness as Effect:

I am interested in self-empowering an individual within their own life experience. To do so, rather than understanding emotions as espoused in literature for the last 3000 years – such as in Homer’s *Iliad* – I wish to break up emotions into their events. Each event or stage of the emotional process can be understood and dissected into their own greater understandings. Within each of these understandings are areas of self-mastery towards one’s own self-empowerment, health, and well-being.

From a scientific perspective, it is unreasonable to have a term such as emotion that as a process it is its own cause and effect. The cause, cognitive activities, must be separated from its effect, brain/body biological changes. Also, these brain/body biological changes are causal to “emotional” feeling awareness must be distinguished as another cause/effect relationship.

From a scientific viewpoint it becomes advantageous to redefine emotions not as a process and series of events and being both cause and effect, but as the *end result* of this process and series of events:

1. Emotions are the perception of biological states/changes precipitated by cognitive activities.

2. Cognitive activities precipitate brain/body biological states/changes that consciousness perceives as emotions.

Emotions, from the neuro-linguistic paradigm as used in literature where emotions can readily be destructive and aberrant and in need of emotional control and emotional regulation is a different linguistic paradigm than that which I am using scientifically. Here, cognitive activities, not emotions, can be destructive and aberrant because they are causal to the
A Standard Cause/Effect Definition of Emotions?

biological states/changes perceived by consciousness. Biological states/changes perceived
by consciousness can now be linguistically understood as emotion. Here, cognitive activities
can be destructive and aberrant and in need of cognitive control and cognitive regulation.
Emotions become nature’s biofeedback mechanism adding a new dimension of
understanding of an individual’s cognitive activities.

Emotions in this sense are a reflection of cognitive activities and as such emotional
awareness can be used to understand and give greater clarity of the current cognitive
activities. And most important, this emotional self-awareness can be used to guide one’s
own cognitive change for one’s own betterment.

There becomes a hugely significant role emotions have evolved into. I must introduce
a new concept here that defines good feeling emotions and bad feeling emotions. Good
feeling and bad feeling emotions have a biological significance. Good emotional feelings
correlate with a healthy biology and negative emotional feelings correlate with an unhealthy
biology. I will discuss this.

If good feeling emotions correlated with an unhealthy activity – such as not eating – the
body, if the feelings were followed, would die. Conversely, if bad feeling emotions
correlated with a healthy activity – such as breathing – the body, if the feelings were
followed, would not survive. This logic can be applied to any of numerous
cognitive/biological/emotional/consciousness-awareness scenarios. Therefore, for the body
to survive the evolutionary process, good feeling emotions must correlate with healthy
biological activity and bad feeling emotions must correlate with unhealthy biological
activity.

The same logic goes for cognitive activity. If a person is cold and hungry and cognitive
activities on how to obtain or create food and shelter were to emotionally feel painful and
miserable, would such creative thought necessary for survival continue? (I hope modern
science has grown beyond the need to torture and starve animal subjects in order to obtain imperial evidence of such a hypothesis.)

From an evolutionary biological perspective, if it feels good, it is good. Therefore, cognitive activity – for societal and cultural ethical advancement – must learn how to reframe emotionally negative cognitive activity into “appropriate” emotional positive cognitive activity. We as individuals in a society must learn how to effectively use emotions to guide cognitive activity and give meaning to the song, “Ac-Cent-Tchu-Ate the Positive”.

Emotions from a scientific point of view – not from the literary paradigm we have learned from birth – cannot be destructive nor aberrant because they are not causal. Emotions are the effect of cognitive causal activity. It is cognitive activity that can be destructive and aberrant. Emotions are but a reflection of that activity. And most important, emotions can be used to understand, guide, reframe, and refine that emotionally negative cognitive activity into emotionally positive activity. It becomes behooving upon society to educate and train its citizenry of the nature of emotions and how to effectively use emotions towards one’s own health, well-being, and prosperity as well as for the health, well-being, and prosperity of the culture/society in which they live.

Wrap-Up:

The book I have written for the common health, well-being, and prosperity of all individuals extends my paradigm of emotions into a psychology where emotions have a synergistic relationship with the mind and body that consciousness can use towards its own enrichment. By dissecting the emotional process into its elements, emotions can become a very useful tool. This book is called Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness. Updated versions can be freely downloaded on https://symbioticpsychology.com/.
I truly hope the world scientific community of psychology and linguistics can realize a common definition of emotions for the good of all beings. I can only trust that the appropriate people and organizations will take any necessary action. As I explained in my previous email (2019-10-29: "Cognition creates the biology that stimulates the emotional neurology consciousness then perceives"), current emotional paradigms can be destructive to you, your family, and your society. Let’s all make an effort to rectify this.

Passionately,

Andrew Jackson

https://symbioticpsychology.com/

https://emotional-evolution.com/

**Emotions and Feelings: Nature’s Biofeedback Mechanism**

Emotions and feelings are felt. Good and bad feeling emotions and feelings are the perception, by consciousness, of a biochemical physiology within the body and the brain precipitated by an evolved and nurtured cognitive neural circuitry. Because emotions and feelings are perceptions of an internal state of biology precipitated by cognition, emotions and feelings are a reflection of, and give insights into, the nature of said cognitive behavior. Also, because emotions and feelings are not causal, emotions and feelings are neither destructive nor constructive but rather they are indicators towards the presence of very real destructive and constructive – and causal – cognitive behaviors. Correlations between cognition, healthy biochemical physiology, and good feeling emotions and feelings are a result of millions of years of evolutionary survival for the health and well-being of the individual – as are the correlations between bad feeling emotions and feelings and an unhealthy biology. Now the question is, how are these correlations between cognition, biology, emotions and feelings, and consciousness understood, nurtured, and developed within a society for an individual’s health, wealth, and general well-being through their own successful decision-making and creativity?
A Standard Cause/Effect Definition of Emotions?

Background Reading:

A Standard Cause/Effect Definition of Emotions?

Public Health Awareness Announcement:
Current psychological and psychiatric emotional theory can be dangerous and harmful to you and your families mental and physical health, well-being, and prosperity.

Subjects:
* Health Hazards of a 3000-year-old neuro-linguistic paradigm of emotions used as science.
* Cognition creates the biology that stimulates the emotional neurology consciousness then perceives.

Date:
2019-10-28

Health Hazards of a 3000-year-old neuro-linguistic paradigm of emotions:
Since I began voicing my concerns over psychological and pharmaceutical therapeutic methodologies erroneously based on a 3000-year-old neuro-linguistic causal paradigm of emotions as laid out by Homer in the *Iliad*, over a million (MILLION) Americans have committed suicide, millions of other Americans have been put in incarcerating conditions that only amplify their psychological injuries, and mass shootings continue with no review of the psychological environments that are oblivious to emotions’ evolutionary design and that are fostering all of these atrocities. Lack of true academic questioning and review of psychological and pharmaceutical emotional theory is a true crime against humanity....

Emotions are an awareness of biological conditions precipitated by cognitive activities, and therefore emotions cannot be aberrant nor destructive and in need of emotional management, control, nor regulation. That would be like saying that the "check engine light" on the dashboard of a car is in need of management, control, and regulation because the light itself is causal to something amiss inside the engine. It is not.
A question for professors, researchers, academics, students in the USA:
Is there a possible legal liability in the 45,000 yearly suicide deaths who may be victims of current erroneous psychological, psychiatric, pharmacologic emotional theory? What would a team of hard driving, competent but unscrupulous lawyers do in a class action suite who represent the devastated family members whose beloved were victims of today’s erroneous emotional theory that is based upon 3000-year-old linguistic emotional folklore? I would like to refer to some background reading by Bob Knight, (2013) The power of negative thinking. New York, NY: Houghton Mifflin Harcourt)

My full argument and basis for my condemnation of current psychological emotional theory can be found on https://emotional-evolution.com/ where the text can be freely downloaded as a PDF for your reading and analysis: Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness.

Detail Outline: The dangers and hazards of a 3000-year-old neuro-linguistic paradigm of emotions used as science.

A. Although current cognitive behavior therapies have evidence-based success, this success is limited and misunderstood because as cognitive behavior does change.
   i. This cognitive behavior change is an intellectual exercise and analysis of existing cognitive activities.
   ii. This cognitive behavior change is incorrectly assumed to change emotional behavior which then changes biological conditions.
   iii. In actuality, changes in cognitive behavior alter biological conditions in the body and brain that stimulate perceptual emotional neurological networks that consciousness then perceives as emotions. (Jackson, 2019)

B. Current therapies are based upon the erroneous premise that emotions change biology and that therefore leads to the following erroneous conclusions:
Emotional Theory Can Be Hazardous to Your Health, Prosperity, and Well-Being

i. dangerous emotions exist.

ii. dangerous emotions such as depression that damage biology must be regulated, controlled, and managed – even with the use of pharmaceuticals. (Gross, 2014), (Maletic, Raison, 2017)

iii. these dangerous emotions drive violent behavior and therefore must be regulated, controlled, and managed.

But emotional behavior doesn’t change biology, cognitive behavior changes the biology that consciousness then perceives as emotions.

C. Emotions are not being utilized to guide cognitive activity as they have evolved to do so.

i. Instead, emotions are prone to be covered-up, ignored, and disregarded. After all, how can aberrant and dangerous emotions be trusted?

ii. And, ignorance of emotions as feedback of cognitive activity - either consciously, unconsciously, or pharmaceutically - can and will lead to the biological engine breaking down because negative emotions have an evolved correlation to an unhealthy biology. And, conversely, positive feeling emotions have an evolved correlation to a healthy biology. (Jackson, 2019)

D. If emotions were to be managed and controlled by pharmaceuticals, any therapeutic discourse of cognitive behavior could be misleading – even invalid – because of the lack of a true cognitive/emotional correlative relationship.

E. If irregular cognitive behaviors are left unaddressed without proper psychological counseling and therapy because emotional reflections of aberrant mental and physical behaviors are ignored or camouflaged with pharmaceuticals, cognition may fester unabated and create a myopic vortex of circular mental and physical behaviors. This psychosis can break out with disastrous consequences to the patient and to others, who may become characters in a manically-conceived tragedy played out in real life.
F. Instead of a brutal and honest questioning of psychological theory, psychological science has created a new cognitive construct – refractory emotional disorders, that is, emotional disorders that are hard to treat. (Rerman, 1997)

i. This neuro-linguistic sleight-of-hand diverts the focus of attention on to the illness rather than on to any possible issues within psychological theory itself.

ii. And, is the illness an emotional disorder or a cognitive disorder?

iii. An emotional disorder would only exist if emotional feedback on biological state/changes were corrupted, akin to near-sightedness or far-sightedness.

G. “Data shows that people committing violent acts are much more accurately characterized by other factors, such as a prior history of aggression, including domestic violence, often with a criminal record including convictions of violent misdemeanor crimes; and of alcohol and drug related offenses. Impulse control problems, trauma, rage, childhood adversity, desperation, financial strain, vindictiveness, narcissism, sociopathy, and psychopathy are all potential risk factors for violence and major problems to address, but they are not the same as a mental health condition.” (Moutier, 2018)

i. If mental illness is defined as the lack of ability for an individual to constructively respond to their own biologically evolved emotional guidance neurology (as it should be), then all these “potential risk factors” ARE a mental health condition.

H. A justice of "punishment for a crime" is inhumane because of its inherent lack of intention to change a person’s destructive cognitive behavior.

i. Should justice be defined as punishment with an intent to inflict pain, suffering, or hardship upon an individual? Or, should justice be defined as an intent to empower cognitive/emotional behavior for the health and well-being of the individual and society?
Emotional Theory Can Be Hazardous to Your Health, Prosperity, and Well-Being

ii. Should our criminal justice system be an extension of “an eye for an eye”?
Or, is justice best served by entrusting individuals with the training, skills, and understandings of their evolved emotional system to make better choices for themselves and others throughout their life.

I. Negative feeling emotions’ role in poverty, or lack of prosperity and success, is erroneously ignored.

i. Typical of an impoverished mind is to focus on that which is not wanted and to get self-absorbed into the problem rather than the solution. Cognitively dwelling and focusing on the problem precipitates a biology that actuates the neurology of negative emotions where any solutions can not present themselves. This problem amplification creates an individual and community vortex of poverty where negative feeling emotions continue to spiral downward creating emotional conditions that act as a barrier to any helpful resources and aid.

J. An impoverished mind, that is, a mind that is self-absorbed within their own emotional negativity is easy prey to mis-information and to blaming others for their disadvantaged conditions because an impoverished mind lacks the ability to respond to their own negative emotions in a natural and healthy capacity.

i. A natural and healthy response to negative feeling emotions, which are indications of current unhealthy cognitive activities, is to use them as a stepping stone to more positive feeling cognitive activities. This step may only be less emotionally negative, but it is a step in the right direction towards emotionally positive feelings. The healthy, wealthy, and wise have realized, consciously or unconsciously, this cognitive capacity to move out of their impoverished and emotionally negative mind. The rest of the world has not.

K. Why is there not a warning and public promotion of the physical health hazards of negative emotions?

Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness
(rev2020-01-23a)
i. The importance of the evolved emotional awareness and its correlations to human biology is vastly being overlooked by the medical community.

ii. Since negative emotions have an evolved correlation to an unhealthy biology, a person’s nature ability to ward off disease and illness is also effectively constrained.

iii. Cancer is a leading cause of death worldwide, accounting for an estimated 9.6 million deaths in 2018. The most common cancers are: lung (2.09 million cases) and breast (2.09 million cases). (WHO, Cancer key facts) None of the correlated risk factors include the presence of negative emotions which is a direct indicator of a biological weakness and vulnerability.

L. Physical health assessment, examination, and therapy does not include a risk assessment due to current and long-term emotional states/changes. Any attempt to understand and affect the internal human environment must be taken with an understanding of the changing biochemical conditions of that environment as indicated by an evolved emotional neurocircuitry of the human body/brain.

M. A symbiotic relationship between mind, body, emotions and consciousness where cognition rather than emotions changes biology is not likely be acknowledged by the academic community because it runs counter to 3000 years of neuro-linguistic programing.

i. Language literature understanding and comprehension reinforces today’s biologically incorrect emotional paradigm that emotional behavior changes the body/brain’s biochemistry and physiology.

ii. Characters in a story driven by lust, greed, hate, anger, vengeance, or even love, joy, or passion has been the plot in literature since Homer’s Iliad over 3000 years ago. Even today, our “scientific” conception of emotions has been neuro-linguistically molded from childhood through family interactions and in later years through reading and neurolinguistic comprehension of literary
works such as Dickens’s Great Expectations, Lee’s To Kill a Mocking Bird, and Austen’s Pride and Prejudice.

N. A cognitive-emotional symbiotic behavior therapy for violence and mental illness will not likely be funded, and may even be purposely maligned, because:

i. it is detrimental to the pharmaceutical, health insurance, hospital/medical, and incarceration industries whose profits are based on a business model of nurturing a sick population.

ii. Corporations have a fiduciary duty to their stock holders. This means monetary profits must be their priority with any investment decisions.

iii. Investing in an intellectual paradigm that diminishes profitability by promoting healing and even full recovery rather than in a product that adds to their financial health and well-being could inanely be taken as fiduciary irresponsible and even criminal.

iv. A cognitive-emotional symbiotic behavior therapy that denies the reality of aberrant and destructive emotions driving biological change runs contrary to today’s academic theories and beliefs. These academics are also advisors and consultants for evaluating research proposals and their funding.

What value are evidence-based practices (EBP) in psychological and pharmaceutical therapies going to be for:

- the 47,000 people who are going to kill themselves in the USA next year? (AFSP, Suicide Statistics).
- our children who are going to be shot in the next mass shooting?
- the over 9,000,000 people globally who are going to die of cancer next year? (WHO, Cancer, Key Facts)
- the over two million people locked within our judicial system (Wikipedia, Incarceration Rates) that cares more about the due process of punishment than understand that the brains neuro-plastic ability can change a personal reality of violence into a personal reality of well-being.
Where is the research to understand consciousness’s ability to use emotional awareness of feeling good or feeling bad as biofeedback to guide cognitive activity and to create a biology of health, prosperity, and well-being?

Because mental sciences’ definition and use of emotions is an extension of a 3000-year-old linguistic paradigm as defined in Homer’s *Iliad*, is it now possible to comprehend that emotions are but one part of a mind, body, emotion, consciousness symbiotic relationship, all working together for the promotion of physical and mental well-being? This realization is already innately understood by the healthy, wealthy, and wise. Can it be taught to the sick, impoverished, and ignorant?

"Find a Better Feeling Thought"*

Rather than demonizing emotions as aberrant, destructive, out-of-control and in need of regulation because of an emotional disorder, Symbiotic Psychology understands emotions as an evolved sensory system, akin to the sense of pain, giving conscious feedback of a state of biochemical physiology. Emotions, instead of being regulated by cognitive behavior, are used to guide cognitive behavior for the health, well-being, and prosperity of the individual.

The role of the healthy, wealthy, and wise is not to support the less advantaged but to empower the less advantaged with the necessary cognitive-emotional skills, abilities, and motivation to manifest their own destiny through their own powers of creation.

Current Erroneous Emotional Paradigm:

Emotional regulation, control, and management evolved from the associations made between aberrant and destructive emotions – such as hate, anger, revenge, fear, jealousy, and, depression – and observable destructive behavior. These associations are further reinforced with evidence of correlated biochemical and physiological changes within the body/brain, and with such evidenced-based practices as cognitive

*Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness* (rev2020-01-23a)
behavior therapy and mindfulness, along with an assortment of evidenced-based psychiatric practices within pharmaceutical therapies. (ref. background readings)

But these practices and therapies are limited because they fail to comprehend emotions’ evolutionary role of guiding cognitive behavior and that emotions are the perception of biological states/changes precipitated by cognitive activities.

Emotions as the perception of biological states/changes precipitated by cognitive activities:

My text, *Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness* – which can be freely downloaded at [https://symbioticpsychology.com/](https://symbioticpsychology.com/) – contains my vision and roadmap towards new educational endeavors based on the mind, body, emotion, and consciousness neurological networks and relationships that have evolved over 100’s of millions of years. The purpose of this “Public Health Awareness Announcement” is to bring this new cognitive construct of emotions – and its educational possibilities – into the light with the hope that action will be taken to research and develop age/cultural appropriate literature and texts so that individuals around the world can have their own emotional intuition, awareness, and capacity for health, wealth, and wisdom as today’s healthy, wealthy, and wise.

*Only when the illusion of emotions is understood, will the power of emotions be revealed.*

Analogy:

Emotions are akin to the check-engine-light on the dash of a car. The light signifies problems within the mechanical physiology of the engine. The light is not the cause of the problem. The light is not aberrant nor destructive, but has mechanically evolved to bring to conscious awareness any potential problems within the engine,
that if left unresolved, will lead to mechanical breakdown and failure – akin to what is
observed in the biology of depression and anxiety that leads to suicide. Are people
also ignoring, covering up, or taping over an emotional check-engine-light that
signals biological susceptibility to illness, disease, and cancer?

Current literary education:
Characters driven by lust, greed, hate, anger, vengeance, or even love, joy, or passion
has been the plot in literature since Homer’s Iliad over 3000 years ago. Even today,
our conception of emotions has been linguistically molded from childhood through
family interactions and in later years through reading literary works such as Dickens’s
Great Expectations, Lee’s To Kill a Mocking Bird, and Austen’s Pride and Prejudice.

A shared cultural and linguistic development of core beliefs and conceptual
understandings about emotions is required for young students to comprehend and
follow the emotional twists and turns within these popular English literary works. As
students mature and are introduced to the more advanced works of William
Shakespeare and others, comprehension is even more dependent upon prior
assimilation of cultural and linguistic paradigms. Conceptions of emotions are
further reinforced by the logic and reason applied in today’s scientific literature,
research, and discussions about emotions.

Is it now possible to introduce a different linguistic paradigm of emotions without it
immediately being rejected because conceptually it runs counter to our neuro-
linguistic paradigms that have shaped our core beliefs and understandings of
emotions since birth?

Any attempt to understand and affect the internal human environment must be taken
with an understanding of the changing biochemical conditions of that environment.
Emotions, within a different paradigm, may just be the indicator needed by the
Emotional Theory Can Be Hazardous to Your Health, Prosperity, and Well-Being

general public to (1) interpret this vast and complex internal environment of
changing biochemical conditions and for (2) understanding and guiding their own
cognitive and physical behavior towards their own health, well-being, and prosperity.

Symbiotic mind, body, emotions, consciousness synergistic paradigm:
1) Emotions cannot be destructive, nor constructive, in themselves because
emotions are consciousness’s awareness of a biochemical physiology
precipitated by destructive, or constructive, cognitive activities.
2) Negative feeling emotions are indications that abusive and damaging
cognitive behavior is creating unhealthy and destructive biochemical
conditions.
3) A person cannot be “emotionally out of control”; that is a misnomer.
a. Since emotions are the awareness of biological states/changes
precipitated by cognitive activities, instead of a person being
emotionally out of control, they are cognitively out of control.
4) Emotions are what a person feels.
5) Cognition is about what a person thinks.
6) Emotions either feel good or feel bad.
7) Cognition deals with the processes of knowing and awareness, namely,
perception, recognition, conceiving – which includes imagination and
inspiration – and reasoning (Encyclopedia Britannica, Cognition: thought
process).
8) Emotions are the perception of biological states/changes precipitated by
cognitive activities.
9) Emotions can change biology through cognitive awareness of said same
emotional feelings, much like a microphone/speaker reverb feedback loop.
10) Words that describe emotions such as love, joy, excitement, hate, and anger
are neuro-linguistically an association between the awareness of emotional
perceptions and an awareness of cognitive activities.
11) Self-indulgence in continual fear IS a mental illness.
12) Mental illness is the lack of mental well-being where a person has become incapable of responding to their emotions – responding not as emotions have been linguistically programed from birth but responding as emotions have evolved through the ages – to guide one’s own cognitive activities towards physical and mental health, wealth, and well-being.

13) Mental illness is defined as the inability of an individual to constructively respond to their own evolved emotional biological neurology of awareness with the understanding that “constructively” is very subjective.

14) Neuroplasticity is the fact that the brain can rewire itself. (Begley, 2013), (Doigde, 2015)

15) The https://emotional-evolution.com/wp-admin/edit.php?post_type=page neural networks that supported a reality and the cause of violent behavior yesterday, those same neural networks have the physical capacity to change today and to no longer have the capacity to support that violent reality and behavior tomorrow.

16) The neural networks that supported a reality and the cause of nonviolent behavior yesterday, those same neural networks have the physical capacity to change today and to no longer have the capacity to support that non-violent behavior tomorrow.

17) What is criminal justice without positive neuroplastic growth and change?

18) Neuroplastic capacity of learning is accentuated with positive emotional feelings which signify a healthy biology, and suppressed with negative emotional feelings which signify an un-healthy biology. (Katz, Sprang Cooke, 2012, Sept).

19) Negative emotions are negative because of what negative emotions are. By the necessity of surviving the evolutionary process, emotionally negative feelings have an evolved correlative relationship with (1) a dis-harmonious and un-healthy biology and (2) its consciousness awareness thereof while (3) being aware of and focusing upon that which is not wanted.
Positive feeling emotions are positive because of what positive emotions are. By the necessity of surviving the evolutionary process, emotionally positive feelings have an evolved a correlative relationship with (1) a harmonious and healthy biology and (2) its consciousness awareness thereof while (3) being aware of and focusing upon that which is wanted.

Positive feeling emotions are the awareness of potentially harmonious and healthy biological states/changes of the body/brain.

Negative feeling emotions are the awareness of potentially, if left unabated, dis-harmonious and unhealthy states/changes of the body/brain.

The burden of emotional negativity that comes from dwelling upon unwanted and undesirable conditions creates its own vortex of cognitive and physical behaviors that disallow a reconstructive awareness and action upon desirable cogitative and physical behaviors. (Katz, Sprang, Cooke, 2012)

By moving thought and debate up into the “mammalian brain”, a ‘what feels good is good’ mentality can expand into a broader and greater awareness of both short and long-term consequences so that decision-making and action can mature into greater complexity and imagination and have a passionate foundation for existence. (Laurent, 2016), (Naumann, 2015)

Dis-harmonious and unhealthy body/brain conditions, as indicated by negative feeling emotions, are susceptible to illness, disease, and cancer.

Harmonious and healthy body/brain conditions, as indicated by positive feeling emotions, are resilient to illness, disease, and cancer.

Any assessment of physical health and wellbeing or illness, disease, or cancer, and/or potential risk of illness, disease, or cancer must include an assessment of long-term emotional changes/states of being.

Well-being and the success of any professional therapy, mental or physical, is not defined by the absence of illness or symptoms but by the presence of health, vigor, and joy along with the presence of the necessary cognitive skills, abilities, and motivation to nurture these conditions by employing one’s own emotional guidance.
The ability to reconstruct emotionally negative cognitive activities and awareness to emotionally positive cognitive activities and awareness can be nurtured, learned, and developed.

Section 8.2: “Cognitive-Emotional Rehabilitation and Strengthening Exercises, aka, Wellness Training (Your Superhero Toolkit)” of the Symbiotic Psychology text outlines a multiple number of disciplines each containing any of a number of techniques that are currently available to reconstruct emotional negative cognitive activities.

The best “cure for cancer” may just be a cognitive awareness and response to one’s own constructive emotional guidance, i.e., “the best defense is a good offence”.

“Happy” people – those without the continuous burden of emotionally negative cognitive activities – are healthier, more prosperous, and more successful in life. (Lyubomirsky, King, Diener, 2005)

Emotions have evolved to guide cognitive behavior but, beware of the “Dark Side” of emotional guidance (Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness, Section 9).

Cognitive-Emotional Rehabilitation and Strengthening Exercises, aka, Wellness Training:

Why are there not wellness training and self-empowerment education classes in every public school in the nation? Why is the significance of emotional awareness and its correlations to physical health, well-being, social success, and prosperity not being realized nor acknowledged by our mental and physical health academia?

We must become a nation of self-empowered citizens. Self-empowerment should not be a matter of birth nor luck but a matter of intent and design. Everyone has the power of emotional guidance, but only a few have become fortunate to realize that power. The strong and powerful should not support the less fortunate, but teach the
Emotional Theory Can Be Hazardous to Your Health, Prosperity, and Well-Being

less fortunate the power, strength, and wisdom that lies hidden within their biological neural networks of emotions. Humanity’s emotional guidance system is the pinnacle, and has the power, of hundreds of millions of years of successful evolutionary conflict and survival. Let those that have realized that power, teach that power.

The first “Council on Youth Fitness” was created by President Eisenhower. President Kennedy, who changed its name to "The President's Council on Physical Fitness", wrote over 50 years ago in Sports Illustrated, “We do not want in the United States a nation of spectators. We want a nation of participants in the vigorous life. We are under-exercised as a nation; we look instead of play; we ride instead of walk… Physical fitness is the basis for all other forms of excellence.” (JFK Library, Physical fitness)

The success of our teachers in life – whether they are our parents, teachers and other students in school, religious leaders, or bosses at work, or the powerful academia, political, and business leaders who set the stage for our lives – their success is in their ability to empower others with the skills and abilities to think and to feel good and to move thought and debate up into the “mammalian brain”. Here a “what feels good is good” mentality can evolve into a broader and greater awareness of both short and long-term consequences, so that decision-making and action can mature into greater complexity and imagination. Thus ‘what feels good is good’ can have a compassionate foundation for existence.

Section 8.2: Cognitive-Emotional Rehabilitation and Strengthening Exercises, aka, Wellness Training (Your Superhero Toolkit) of the Symbiotic Psychology text presents a roadmap guide for understanding wellness training and how a wellness training program can be integrated into education (Jackson, 2019)
Summary:

Well-being and the success of any professional therapy, mental, emotional or physical, is not defined with the absence of illness but by the presence of health, vigor, and joy along with the necessary cognitive skills, abilities, and motivation to nurture these conditions with one’s own emotional guidance.

The acceptance of current psychological and psychiatric theories and practices lies within their successful integration of multiple cognitive constructs within an intuitive linguistic framework. The danger to you and your family lies not with the proven success of psychological theory and practice, but with its lack success. A psychology that is helpful to many may also be fueling the violence, poverty, and ignorance of others because of its lack of understanding and recognition of the hazards of cognitive behavior therapies and their management, control, and regulation of emotions.

What is lacking is a Detective Columbo like questioning of some very basic assumptions and correlations within current psychological theory that has existed within literary folklore for thousands of years. These assumptions and correlations are still being linguistically programmed within students every day in literature comprehension classes around the world.

The basic belief uniting these assertions is that emotions change biology. Because the idea that emotions change biology is a basic belief fundamental to today’s psychology and which has been linguistically programmed since birth and reinforced throughout early literature understanding and comprehension classes, its questioning is almost automatically disregarded. Are not emotions also the perception of biological changes such as a faster beating heart, a tightening of the stomach, or the quickening of the breath? If that be the case, then emotions are both the cause of biological change and the perception of the same biological change. That is, emotions are both cause and effect. Is this scientifically sound logic? Or is this logic quietly being ignored.
Emotional Theory Can Be Hazardous to Your Health, Prosperity, and Well-Being

because of the proven success of evidenced-based practices of modern psychology and psychiatry?

There is a solution that only mildly disrupts the apple cart and that will maintain the validity of thousands of research papers and advance the future of psychological research and practice into completely new and beneficial paradigms. Instead of emotions changing biology, cognition changes the biology that consciousness then perceives as emotions. An awareness of the cognitive activity that precipitated any biological changes/states plus an awareness of said biological changes/states gives rise to emotional intelligence. But it is precisely the management of emotions rather than the management of the cognitive activities from which the biological states/change arose that presents a danger and the manifestation of destructive behavior.

There is a key difference between the paradigms of “emotions guide cognitive behavior” and “cognitive behavior regulates emotions.” Within the construct of “cognition regulates destructive emotional behavior,” it is the intellect which identifies, determines, and defines destructive emotional and biological behavior as well as identifies, determines, and defines the cognitive behavior which causes this destructive emotional behavior. Within the construct of “emotions guide cognitive behavior,” it is the very presence of negative emotions which identifies, determines and defines destructive cognitive and biological behavior. If emotions are the perception of biochemical physiology, then negative feeling emotions are the indication of very real aberrant and destructive cognitive and biological behavior.

Emotions provide meaningful and necessary insight into a person’s cognitive activities and their resulting constructive or destructive biological and physical activities. Both the therapist and the patient can use emotions to guide personal, psychological, and psychiatric activities. That which feels good is good (biologically), that which feels bad is bad (biologically). Intellect’s role, rather than
Emotional Theory Can Be Hazardous to Your Health, Prosperity, and Well-Being

to define and regulate aberrant and destructive emotions, should be found in its
creative capacity to define cognitively that which is wanted and desired and which
feels good, while in keeping with personal and, to some extent, parental, societal and
religious ethical codes of behavior.

The great advantage of this paradigm adjustment is that now cognitive behavior
therapies are not only an important and necessary tool for physical health and well-
being, these therapies may very well prove to be a more effective and robust tool in
the treatment of severe bipolar and psychotic disorders, suicidal depression, and other
very demanding illnesses. With emotional guidance training and with a new battery
of pharmaceutical medications emphasizing cognitive self-management, true healing
may become the new norm.

Emotions have evolved to be part of a synergistic whole where cognition,
biochemical physiology, emotions, and consciousness work cooperatively in a
symbiotic nature for the health and well-being of the individual.

A more complete discussion can be found in my book, Symbiotic Psychology: The
Synergy Between Mind, Body, Emotions, and Consciousness. This text can be
downloaded as a PDF from: https://symbioticpsychology.com/.

Passionately,

Andrew Jackson
Symbiotic Psychology

The greatness of the human life experience emerges from the flames of individual
desire arising out of hell’s fiery conflicts on earth. Intention is forged in these
fires. Emotional guidance aligns our journey with these new intentions. Each
Emotional Theory Can Be Hazardous to Your Health, Prosperity, and Well-Being

succeeding generation will have its own mountains to climb and waters to cross
with their own stars to navigate towards. Intent is that guiding star; and it is our
emotions that perceive its light. The more joyous the feeling, the more harmonious
and powerful the wonders revealed through life’s journey.

Emotional Theory Can Be Hazardous to Your Health, Prosperity, and Well-Being

Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness (rev2020-01-23a)
Any attempt to understand and affect the internal human environment must be taken with an understanding of the changing biochemical conditions of that environment. Emotions, within a different paradigm, may just be the indicator needed by the general public to (1) interpret this vast and complex internal environment of changing biochemical conditions and for (2) understanding and guiding their own cognitive and physical behavior towards their own health and well-being.

Dear Researcher,

Emotions, one of the foundational pillars of psychological theory, are commonly conceived as aberrant and destructive forces which drive biological changes. This letter is an introduction to a new perspective which shows (1) this is a misconception of emotions and (2) a corrected representation of emotions reveals their evolved biological role in the maintenance of individual health and well-being.

I am writing to you because I believe there is an important connection between linguistics and current misrepresentations of the nature of cognition and emotions and their biology within modern psychological and psychiatric theory that also impacts the study and practice of internal medicine.

Have English speaking researchers’ core beliefs of emotions – which may have been linguistically molded from childhood through family interactions and in later years through reading literary works such as Dickens’s Great Expectations, Poe’s The Raven, and Austen’s Pride and Prejudice – impacted their current understanding and scientific research about emotions and cognition?
Dear Researcher: Emotions: The Linguistics of Science and Shakespeare

A shared cultural and linguistic development of core beliefs and conceptual understandings about emotions is required for young students to comprehend and follow the emotional twists and turns within these popular English literary works. As students mature and are introduced to the more advanced works of William Shakespeare and others, comprehension is even more dependent upon prior assimilation of cultural and linguistic paradigms. Conceptions of emotions are further reinforced by the logic and reason applied in today’s scientific literature, research, and discussions about emotions.

According to current psychological theory, destructive and aberrant emotions must be managed because of emotions’ influence upon biology. The development of emotional intrigue as found within the interplay of literary characters aligns with the paradigm of emotions as expounded in today’s psychological theories. Many literary plots are driven by the characters’ mismanagement of their emotions, or are even controlled and driven by their emotions of the moment.

The basic belief in emotional management is the foundation of Cognitive Behavior Therapy (CBT) where cognitive activities are employed to manage emotions. Congruently, mental illnesses such as depression have identifiable biochemical and neurological signatures where pharmaceuticals are incorporated into CBT practices to aid in emotional management.

Does linguistic development and associated ideas about emotions lead to a cultural research bias within psychological and emotional experimentation because these basic emotional ideas and beliefs, which have been ingrained from childhood, are now coloring the foundation of modern psychology?

I am proposing a different emotional paradigm from that which I have just described above. My question to you is: “how does existing emotional ideology as described above, and the resultant linguistic understanding of emotions, impede one’s
Dear Researcher: *Emotions: The Linguistics of Science and Shakespeare*

understanding and comprehension of an alternative paradigm, which is similarly
developed through scientific principles and logic but which has a different cultural and
linguistic basis for understanding?” The following is a brief presentation of an
alternative understanding of emotions.

From an evolutionary perspective, there must be a positive correlation between the
neural networks that activate (1) a cognitive awareness of strength, vigor and well-
being, (2) an actualization of a physiology of strength, vigor and well-being, and (3) the
neural networks associated with the emotions of pleasure. Biochemistry, both at the
molecular level and at the neural network level, must sustain the correlations between
(1) the cognitive knowing of, (2) the actualization of, and (3) the feeling of strength,
vigor and well-being as well as (4) consciousness’s perception of good feeling
emotions. Simply put, if these correlations did not exist in this way, a being would
have a low probability of survival. (I further develop this argument in my book:
*Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and
Consciousness.*)

Within both paradigms, emotions are perceived – they are a perception of biological
conditions – but within this alternative paradigm, emotions are not causing the
biological condition. A person cannot have an emotional reaction to an event without
first having cognitive awareness and recognition of the event. Cognition deals with the
processes of knowing and awareness, namely, perceiving, recognizing, conceiving –
which includes imagination and inspiration – and reasoning. It is these cognitive
activities which change biochemical physiology and which consciousness subsequently
becomes aware of through emotional perception. Awareness of emotions is in itself a
cognitive activity, which can further drive neurological activity, thus causing a
feedback loop similar to the reverberation effects of a microphone too close to a
speaker. But it is still cognition which drives biology, not emotions, and therefore it is
these cognitive activities that must be managed, not emotions. Emotions have evolved

*Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness*
(rev2020-01-23a)
Dear Researcher: Emotions: The Linguistics of Science and Shakespeare

as a feedback mechanism to guide cognition for the biological health and well-being of
the individual.

Emotional awareness obtained through specialized neural circuits provides feedback
about how cognitive processes need to be further utilized before any internal cognitive
deliberations can be properly concluded and any decisions made. That is, because of
the evolved correlative relationships between cognition, biochemical physiology and
emotions, consciousness is wired to seek cognitive activities that stimulate the
emotional neurocircuitry of feeling good – which correlate to a biochemical physiology
of strength, vigor and well-being. Conversely, any lingering negative emotional
awareness correlates with a weakened biochemical physiology and the need for further
cognitive deliberations. Ignorance of these evolved correlations, either consciously or
subconsciously, would tend to lead to an individual’s demise.

Science has a moral and ethical responsibility to question, explore and reveal reality’s
true nature. Contrary to modern psychological beliefs in aberrant and destructive
emotions, I propose that it is cognitive behavior that changes the body’s biochemical
physiology which consciousness is then perceiving as emotions. Emotions don’t
change the body’s biology as modern psychology currently professes and as such
emotions cannot be aberrant and destructive. Rather, emotions are indicative of aberrant
and destructive cognitive behavior. Emotions are consciousness’s perception of
biological changes precipitated by cognition. Rather than emotional management, I
speak of cognitive and behavior management through the awareness of emotional
feedback.

The significance of this paradigm shift can be further realized within today’s
psychological and pharmaceutical therapy. If emotions are demonized as aberrant
and destructive within an emotional disorder, how can a patient confidently utilize
emotions to guide cognitive behavior? If pharmaceutical therapy targets presumed
emotional aberrations, the very evolved nature of emotions to guide cognition is
Dear Researcher: Emotions: The Linguistics of Science and Shakespeare

sabotaged. Emotional regulation demonstrates a lack of understanding of how
emotions have necessarily evolved for the survival and thriving of our species.

I wrote Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and
Consciousness so people would understand that there are other answers to their
emotional turmoil that modern psychology has failed to understand. My hope is that as
you comprehend my words, current illusions about emotions will be lifted and you will
understand emotions’ scientific significance through your own personal reflection and
thereby understand any possible dogmatic bias of emotions that exists within scientific
research and documentation as well as within any applied psychological and
pharmaceutical therapy.

I am interested in how the researchers within your department might resolve emotions’
reconstruction away from an aberrant and destructive linguistic paradigm – and into a
paradigm of personal cognitive and behavior guidance for the mental and physical
health and well-being of an individual – within their research, discussions, literary
publications and within any Evidence Based Interventions (EBI) based on a cognitive-
emotional correlation.

Somewhere, sometime, somehow, academia must find some common ground. Since I
began voicing my concerns over psychological and pharmaceutical therapeutic
methodologies erroneously based within causal aberrant and destructive emotions, over
a million (MILLION) Americans have committed suicide, millions of other people have
been put in incarcerating conditions that only amplify their psychological injuries, and
mass shootings continue with no review of the psychological environments that are
oblivious to emotions’ evolutionary design and that are fostering all of these atrocities.
Lack of true academic questioning and review of psychological and pharmaceutical
emotional theory is a true crime against humanity.

Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness
(rev2020-01-23a)
Dear Researcher: Emotions: The Linguistics of Science and Shakespeare

I have attached the current revision of *Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness* (166 pages) below. And for an easy assessment by your students, the book can be downloaded at [http://emotional-evolution.com/](http://emotional-evolution.com/). I have also attached a chapter outline for a quick review of the material.

Sincerely,

Andrew Jackson

Postscript:

“There is a danger of medications *masking* destructive cognitive behaviors that normally are exposed through erratic, abnormal, and convoluted emotional feedback. If these *emotional reflections* of aberrant mental and physical behaviors are ignored or camouflaged with pharmaceuticals and if irregular *cognitive behavior* is left unaddressed without proper psychological counseling and therapy, cognition may fester unabated and create a myopic vortex of circular mental and physical behaviors. This psychosis can break out with disastrous consequences to the patient and to others, who may become characters in a manically-conceived tragedy played out in real life.” (ref: Jackson, A., 2019. *Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness*. Section 6.2 Masking Neurological Processes)
The success of our teachers in life – whether they are our parents, teachers and other students in school, religious leaders, bosses at work, or the powerful academia, political, and business leaders who set the stage for our lives – is in their ability to empower us with the skills and abilities to think and to feel good, and to help us move our thought and debate up into the mammalian brain. Here, a “what feels good is good” mentality can evolve into broader and greater awareness of both short and long-term consequences, and decision-making and action can mature into greater complexity and imagination. With such education and personal development, “what feels good is good” can have a compassionate foundation for existence.

Dear Health Care Professional:

Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness outlines a new paradigm of emotional understanding. Rather than demonizing emotions as aberrant, destructive, out-of-control and in need of regulation because of an emotional disorder, Symbiotic Psychology understands emotions as an evolved sensory system, akin to the sense of pain, giving conscious feedback of a state of biochemical physiology. Emotions, instead of being regulated by cognitive behavior, are used to guide cognitive behavior for the health and well-being of the individual.

The basis of healing and well-being is the maintenance of a healthy biological ecosystem. Evolution has provided all species with a unique and misunderstood system of biofeedback that lets each individual be aware of their own biochemical balance and a system of guidance for the care and preservation of this balance. But, because of a lack of precise definition, meaning, and use of terminology in the literature, scientific analysis and experimentation misrepresent this system. In this
book I carefully define terminology and give an order and structure to cognition, biochemical physiology, emotions, and consciousness.

The biologically evolved system of emotions is a system of individual guidance for health maintenance and well-being, which has been misinterpreted until now. The following discussion, *Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness*, provides a unique scientific argument and rationale that emotions have evolved as a biological system with correlative connections to the (a) knowing of physical and mental strength, agility, and vigor, (b) the actuality of physical and mental strength, agility, and vigor and (c) the positive emotional feelings of pleasure, joy, and happiness. But what are emotions?

A person feels an emotion. Emotions are an introspective awareness of a bodily state of being. Analogous to the ‘check engine light’ on the dashboard of a car, a person perceives an emotion. The perception of the light brings a cognitive awareness of an undesirable condition of the engine. We want the light to change, to not indicate a problem; it would be inaccurate to say the light is *out-of-control* and in need of regulation. The light is not in itself aberrant nor destructive and in need of regulation and control. The light is indicative of potentially serious, damaging and destructive conditions within the engine. This potential damage will probably be actualized if the light is ignored, covered up, or deactivated through some artificial means. The light is indicative of a ‘healthy’ or ‘unhealthy’ condition of the engine. Similarly, it is inaccurate to say that emotions are out-of-control and in need of regulation.

The *Handbook of Emotion Regulation* (Gross J., 2014) implies within its title that emotions are something to be regulated because emotional disorders exist where emotions are aberrant, destructive, and out-of-control. Gross uses the term *emotional regulation* to mean “shaping which emotions one has, when one has them, and how one experiences or expresses these emotions” (Gross, 1998b). But this characterization is flawed. It would be better to characterize the situation as follows:
there is a need to shape the cognitive activities of “situation selection, situation 
modification, attentional deployment, and cognitive change” (Gross, 2014) in order to 
regulate these processes for a healthy outcome. It is the processes of “situation – 
attention – appraisal” (Gross, 2014) that need to be regulated. Therefore, it is these 
cognitive activities that should be identified as aberrant, destructive, and out-of-
control. The nature of the disorder is cognitive and, therefore, there is a need for 
cognitive regulation.

The distinction between emotional regulation and cognitive regulation is critical. 
Within severe mental illnesses such as psychotic mania or suicidal depression, 
whether emotions are being regulated or cognition is being regulated can be very 
consequential, especially with the use of pharmaceuticals. Both the patient and the 
therapist use emotional feedback as a meaningful measurement and understanding of 
the cognitive processes being utilized by consciousness. But emotions that are 
demonized as aberrant, destructive, and so out-of-control that they must be regulated 
and brought under control, cannot also be used as a trusted feedback mechanism. 
This mechanism evolved over millions of years for the individual’s health, well-
being, and survival. Medications and practices that aim to regulate and control 
emotions invalidate the very therapeutic process that aims to rely on this mechanism 
for healing.

Within the Handbook of Emotion Regulation (Gross J., 2014), discussion of the 
sequence of “situation – attention – appraisal – response,” suggests that situation, 
attention, and appraisal are causal to the effect response. But what are the 
cause/effect relationships within this emotional response, that is, between the 
“experiential, behavioral, and neurobiological response systems?” (Gross J., 2014) 
Gross’ views about cause and effect are unclear. The same lack of clarity arises 
within the all-encompassing cause/effect order within the “environment” of 
“thoughts, physical reactions, moods, and behaviors” of Mind over Mood 
(Greenberger, D., Padesky, C., 2016). This lack of a distinct cause/effect order lies in
part, or maybe because of, the commonly accepted cause/effect relationship as illustrated in *Cognitive Behavior Therapy: Basics and Beyond* (Beck, J., 2011) where *emotion* is characterized as causal to the effect *physiological response*.

If emotion is causal to a physiological response, then it makes sense to regulate emotions. But if the definition of emotion encompasses the physiological response, this would imply that emotions are causal to emotions. Furthermore, the effect phenomenon of emotional responses is without a clear distinction about what the conscious “I” is perceiving and when this occurs within a sequence of events. The significance and importance of consciousness’s perception of a good or bad feeling emotion or mood is not addressed within these models. Psychological, psychiatric, and pharmaceutical therapies, on which biological health and well-being are dependent, are based upon altering cognitive behavior to change emotional biology, but integration of the discussion of these neural networks and circuits with a concept of the conscious individual “I” needs greater clarity.

Can we reorganize and alter the elements of cognitive behavior therapies without changing the basis of success of these therapies, that is, in their ability to change cognitive activities and cognition, which thereby changes emotional experiences and their correlative biochemical physiology? What if, rather than viewing *emotions* as causal within a loop which produces the physiological and biochemical responses in the brain and body, we were to view *cognitive activities* as the producers of these physiological and biochemical responses? Emotions could then be understood to be the perception of these physiological/biochemical responses. The conundrum of emotions both triggering physiological/biochemical responses and being the response to physiological/biochemical changes is relieved, and the research on the effectiveness and success of cognitive behavior therapies is maintained as follows:

An experience within an environment of core beliefs stimulates thought and other cognitive neural network activities. These cognitive activities (perception, recognition, conceiving – which includes imagination and inspiration – and...
reasoning) initiate a biochemical/physiological reaction within the brain and body. It is this biochemical physiology of the brain/body that actuates the neural networks of emotional perception that consciousness perceives, experiences as emotions, and uses to further modify cognitive activity.

Negative feeling emotions are indications that abusive and damaging cognitive behavior is creating unhealthy and destructive biochemical conditions. Furthermore, these damaging biological conditions would worsen if emotional behavior were not to be acknowledged or were to be deliberately suppressed or ignored. This would be especially concerning if emotions were to be managed and controlled by pharmaceuticals, which could easily make any therapeutic discourse of cognitive behavior misleading and even invalid because of the lack of a true cognitive/emotional correlative relationship.

There is a key difference between the paradigms of “emotions guide cognitive behavior” and “cognitive behavior regulates emotions.” Within the construct of “cognition regulates destructive emotional behavior,” it is the intellect which identifies, determines, and defines destructive emotional and biological behavior as well as identifies, determines, and defines the cognitive behavior which causes this destructive emotional behavior. Within the construct of “emotions guide cognitive behavior,” it is the very presence of negative emotions which identifies, determines and defines destructive cognitive and biological behavior. If emotions are the perception of biochemical physiology, then negative feeling emotions are the indication of very real aberrant and destructive cognitive and biological behavior.

Emotions provide meaningful and necessary insight into a person’s cognitive activities and their resulting constructive or destructive biological and physical activities. Both the therapist and the patient can use emotions to guide personal, psychological, and psychiatric activities. That which feels good is good (biologically), that which feels bad is bad (biologically). Intellect’s role, rather than
Dear Health Care Professional: Redefining Therapeutic Success

to define and regulate aberrant and destructive emotions, should be found in its
creative capacity to define *cognitively* that which is wanted and desired and which
feels good, while in keeping with personal and, to some extent, societal and religious
ethical codes of behavior.

The great advantage of this adjustment of a paradigm is that now cognitive behavior
therapies may very well prove to be a more effective and robust tool in the treatment
of severe bipolar and psychotic disorders, suicidal depression, and other very
demanding illnesses. With emotional guidance training and with a new battery of
pharmaceutical medications emphasizing cognitive self-management, true healing
may become the new norm. These new pharmaceuticals should only be used as a
temporary crutch to aid the patient’s conscious control of cognitive behavior as
guided by their own emotional guidance.

*Well-being and the success of any professional therapy, mental or physical, is not
deefined by the absence of illness but by the presence of health, vigor, and joy along
with the necessary cognitive skills, abilities, and motivation to nurture these
conditions by employing one’s own emotional guidance.*

*Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and
Consciousness* outlines a new paradigm of emotional guidance training.

Sincerely,

Andrew Jackson

Subject: Become Your Own Superhero

Date: rev2019-01-10a

Dear Patient,

How bad is it? How bad do you want what you don’t have? How bad do you want to have the good life that others have, and you don’t. If you are a prisoner in jail, what do you want? If you are angry and mad at everything in the world, what do you want? If you are alone, hiding in a room, never wanting to see the light of day, what do you want? If you are in poverty and living in filth, with never enough food or warm clothes, what do you want? If you are sick and in misery, what do you want? If you are depressed with nowhere to turn but death, what do you want? If you are on drugs or alcohol and your life is in ruins, what do you want?

I was mentally insane with delusions and voices flying around my head. I was crying out for God to kill me. I blacked out and awoke with a rope in my hand to make it all end when a voice asked me, “Can you go on?” I got myself back into a mental hospital and stayed alive. I blacked out and awoke in a padded cell. They doped me on medications and minute by minute, hour by hour, day after day I spent walking the hospital halls. When released, nightly I roamed the deserts around El Paso until I ended in jail, beaten and bruised but still picking a fight with the biggest man in the cell. A voice wanted me to stay alive and continue my madness in hell. I said, “I can.”

Sharon, my new therapist, when I described my psychotic episodes found them hilariously funny and she created a path for me to join her in her laughter. We both had a good laugh when I described the time I brought the police over to my friend who was in trouble. My friend was a garbage can!? She gave me a task, “Can you find something for yourself, today,
Dear Patient: Become Your Own Superhero

under these miserable conditions, that will make you feel a little better, make you feel a little
less pain? Can you do something for yourself today? And can you do it again the next day?
And the next?” From then on, I made the time to bath in the light of our apartment’s
swimming pool. With my face mask and snorkel on, I just stared at the drifting shadows at
the bottom of the pool.

Another person who taught self-empowerment through joy was Esther and her inner circle of
friends called Abraham. They introduced me to the power of my inner guidance through
listening to my emotions. They spoke of emotional guidance as the key to my inner strength
and power. From there, I had my eureka moment. If I was depressed or manic and I had a
“chemical imbalance”, then when I felt better would my “chemical imbalance” be more of a
“chemical in-balance”. That is, in the times when I felt a little better, or actually, less bad,
was my biochemistry also a little better? My emotions truly became my inner guide to
honor, wealth, justice and freedom.

Like a hamster running no-where on a wheel in a cage, I was caught in an endless loop of
being drugged when on medications and psychotic mania when off medications. Then I met
the “Salsa Doctor,” so called because he played in a salsa band in Ciudad Juarez. He worked
with the idea that I could get better. That as I gained more control of my psychotic mind
through the guidance and power of my emotions, I would need less invasive medications.
My ‘Program to Freedom’ had its setbacks. I ended up in jail, my wife called for a divorce,
but after four years of continuous conflict, I saw my last mental health caregiver.

From 1979 to 1996 I kept ‘going on’…. for over 15 years I searched for a path to free me
from my own mental hell. I found it in the high deserts of El Paso, TX. Now, over 20 years
later, I am writing this to give you hope. I found a path, a way out of hell. I am happily
married. I am happily retired. I am still learning how to enjoy life, but I am enjoying life.
I found that success means bringing a “healthy attitude” to life and to the daily, moment to
moment decisions, especially to the choices that are made on what to think and dwell upon. I
found that a healthy attitude means having the desire and intention to choose ideas, thoughts,
beliefs, concepts, awarenesses, deductions, reasons, dreams, and imaginations that feel good.

I found that people who are successful enjoy life because they have made a decision to focus on what feels good. I found that success and having what you want means learning how to feel better. I found that health and well-being are dependent on focusing on what feels good and that mental health absolutely depends on the ability to focus on what feels good.

I found that problems occur when a “what feels good is good” attitude does not get out of the lower, “reptilian brain”, the part of us that evolved first, a kind of “if it moves, eat it” mentality and into the “mammalian brain” where more intricate and complex issues may be resolved with a greater all-encompassing harmony.

The success of our teachers in life – whether they are our parents, teachers and other students in school, religious leaders, or bosses at work, or the powerful academia, political, and business leaders who set the stage for our lives – their success is in their ability to empower others with the skills and abilities to think and to feel good and to move thought and debate up into the “mammalian brain”. Here a “what feels good is good” mentality can evolve into a broader and greater awareness of both short and long-term consequences, so that decision-making and action can mature into greater complexity and imagination. Thus “what feels good is good” can have a compassionate foundation for existence.

When I came to the point in my life when I understood that ‘where I am is not my fault but it is now my responsibility,’ that is when life started getting better for me. It takes effort. But if you have the desire to improve and empower your own life, start using your emotions and understand that if a thought doesn’t feel good, it’s not. If what you are doing in life doesn’t feel good, it isn’t good, for you or anybody around you. You have to become your own ‘superhero’.

Life can become good! Here is a psychology and therapy for anyone to use. If your life or the life of some you know hasn’t been improving with the ‘help’ they are getting…. here is what
Dear Patient: Become Your Own Superhero

worked for me. I know it can work for you. Become your own superhero and take charge of your own life: http://emotional-evolution.com/.

Because every superhero needs their own mental super powers, http://emotional-evolution.com/cognitive-emotional-therapy/ tells you how to get them. This latter section deals with the nuts and bolts that you can use to rebuild your own life into something wonderful, a life that you can enjoy and where you can actually feel good most of the time.

The whole book can also be downloaded for you to dwell upon at your own pace and convenience (check the menu bar).

Good luck! “Life is a state of mind” (from the movie Being There). Make your state of mind one you like. It all can start with an intention to do something to feel less bad today! With this one step, to do something to feel a little better, you will learn that you do have a power……not the power of a victim, but the power of a warrior, of a warrior knight, of a “Jedi Knight” (ref. Star Wars movie).

Sincerely,

Andrew Jackson

Subject: Empowering ALL Students to Succeed and to Thrive

Date: 2019-08-17b

Dear Board of Education,

What is the purpose of education if it is not to provide the tools and training for a successful adult life? And where is success without the joy and passion that signifies mental and physical health and well-being? Can education be called a success if it does not provide the understanding and training of a personal cognitive-emotional system which has evolved for the actualization and maintenance of mental and physical health and well-being? Education should not be confined to developing a student’s cognitive skills without also understanding the importance and significance of their emotional connection to happiness and joy. Cognition, physiology, emotions and consciousness have evolved together as a synergistic team. The nature and effective employment of these synergies should certainly be part of our educational curriculum. And this means teaching and developing the students’ skills and abilities to accentuate joyous cognitive and behavior endeavors for their own – and society’s – health, well-being, and prosperity.

The understanding of emotions that drive the characters of Shakespeare are not the understanding of emotions within a science where emotions have evolved for the health, well-being, and prosperity of your students.

Have teachers’ core beliefs of emotions – which may have been linguistically molded from childhood through family interactions and in later years through reading literary works such as Mark Twain’s The Adventures of Tom Sawyer, Dickens’s Great Expectations, Poe’s The Raven, and Austen’s Pride and Prejudice – impacted current understanding and scientific research about emotions and cognition?
Dear Board of Education: *Empowering ALL Students to Succeed and Thrive*

A shared cultural and linguistic development of core beliefs and conceptual understandings about emotions is required for young students to comprehend and follow the emotional twists and turns within these popular English literary works. As students mature and are introduced to the more advanced works of William Shakespeare and others, comprehension is even more dependent upon prior assimilation of cultural and linguistic paradigms. Conceptions of emotions are further reinforced by the logic and reason applied in today’s scientific literature, research, and discussions about emotions.

I am asking you to evaluate your own paradigm of emotions, the very paradigm of emotions that you as educators, are indoctrinating your students with as you teach them how to read and write. You must take responsibility and understand that what began innocently in first grade to learn how to read, write, and understand literature continues within the academic halls of psychology and psychiatry. The emotional paradigm of Shakespeare without a careful introspection of how emotions must have evolved is fostering a society of crime, violence, and suicidal mania. You, as educators must began your own analysis because the psychological academia are only continuing the core beliefs of emotional understanding that you instilled.

Emotions, one of the foundational pillars of psychological theory, are commonly conceived as aberrant and destructive forces which drive biological changes. This letter is an introduction to a new perspective which shows (1) this is a misconception of emotions and (2) a corrected representation of emotions reveals their evolved biological role in the maintenance of individual health, well-being, and prosperity.

According to current psychological theory, destructive and aberrant emotions must be managed because of emotions’ influence upon biology. The development of emotional intrigue as found within the interplay of literary characters aligns with the paradigm of emotions as expounded in today’s psychological theories. Many literary plots are driven by the characters’ mismanagement of their emotions, or are even controlled and driven by their emotions of the moment.
Dear Board of Education: *Empowering ALL Students to Succeed and Thrive*

Somewhere, sometime, somehow, academia must find some common ground. Since I began voicing my concerns over psychological and pharmaceutical therapeutic methodologies erroneously based within causal aberrant and destructive emotions, over a million (MILLION) Americans have committed suicide, millions of other people have been put in incarcerating conditions that only amplify their psychological injuries, and mass shootings continue with no review of the psychological environments that are oblivious to emotions’ evolutionary design and that are fostering all of these atrocities. Lack of true academic questioning and review of psychological and pharmaceutical emotional theory is a true crime against humanity.

Continual education of the linguistics of emotions found in Shakespeare without teaching the linguistics of emotions found within the science of evolution is a true crime against humanity.

According to current psychological theory, destructive and aberrant emotions must be managed because of emotions’ influence upon biology. The development of emotional intrigue as found within the interplay of literary characters aligns with the paradigm of emotions as expounded in today’s psychological theories. Many literary plots are driven by the characters’ mismanagement of their emotions or are even controlled and driven by their emotions of the moment.

From an evolutionary perspective, there must be a positive correlation between (1) a cognitive awareness of strength, vigor and well-being, (2) an actualization of a physiology of strength, vigor and well-being, and (3) the neural networks associated with the emotions of pleasure. Biochemistry, both at the molecular level and at the neural network level, must sustain the correlations between (1) the cognitive knowing of, (2) the actualization of, and (3) the feeling of strength, vigor and well-being as well as (4) consciousness’s perception of good feeling emotions. Simply put, if these correlations did not exist in this way, a being would have a low probability of survival.

*Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness* (rev2020-01-23a)
Imagine what would happen to a person who is drunk and (1) thinks of themselves as strong and capable, but (2) in actuality they are quite confused and clumsy and (3) they feel great and very confident! They perceive themselves as quite capable of driving across town in rush hour traffic. What is their probability survival? (These arguments are developed further in Section 2: “Emotions as an Evolved Biological System” in the attached Symbiotic Psychology book.) We have evolved to be joyous beings. An individual’s mental and physical health depends on their seeking and finding cognitive activities of knowing, namely, perceiving, recognizing, conceiving – which includes imagination and inspiration – and reasoning that feel good. From a biological perspective if it emotionally feels good, it is good.

There is a key difference between a new paradigm of “emotions guide cognitive behavior” and current textbook understanding of “cognitive behavior regulates emotions.” Within the construct of “cognition regulates destructive emotional behavior,” it is the intellect which identifies, determines, and defines destructive emotional and biological behavior as well as identifies, determines, and defines the cognitive behavior which causes this destructive emotional behavior. Within the construct of “emotions guide cognitive behavior,” it is the very presence of negative emotions which identifies, determines and defines destructive cognitive and biological behavior. If emotions are the perception of biochemical physiology, then negative feeling emotions are the indication of very real aberrant and destructive cognitive and biological behavior.

The distinction between emotional regulation and cognitive regulation is critical. Within severe mental illnesses such as psychotic mania or suicidal depression, whether emotions are being regulated or cognition is being regulated can be very consequential, especially with the use of pharmaceuticals. Both the patient and the therapist use emotional feedback as a meaningful measurement and understanding of the cognitive processes being utilized by consciousness. But emotions that are demonized as aberrant, destructive, and so out-of-control that they must be regulated and brought under control, cannot also be used as a
Dear Board of Education: Empowering ALL Students to Succeed and Thrive

trusted feedback mechanism. This mechanism evolved over millions of years for the
individual’s health, well-being, and survival. Medications and practices that aim to
regulate and control emotions invalidate the very therapeutic process that aims to rely on
this mechanism for healing.

To have cognitive-emotional wisdom is to have the cognitive and emotional understandings
and abilities to avoid acting from the lower platforms of despair, depression, and anger.
Cognitive-emotional wisdom means to have the cognitive tools and agility to move up the
emotional staircase and to act from the higher platforms where good feelings of clarity,
health and vigor reside. Section 7.0: “Cognitive-Emotional Wisdom” of this book
discusses a variety of cognitive-emotional wisdom themes relevant to today’s culture and
society. But it is Section 8.2: Cognitive-Emotional Rehabilitation and Strengthening
Exercises – a student’s “Superhero Toolkit” – that contains the heart of developing a K-12
curriculum with activities that reinforce the synergies between mind, body, emotions, and
consciousness.

I wrote Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and
Consciousness so people would understand that there are other answers to their emotional
turmoil that modern psychology has failed to understand. My hope is that as you
comprehend my words, current illusions about emotions will be lifted and you will
understand emotions’ scientific significance through your own personal reflection and
thereby understand the linguistic differences between the emotions of Shakespeare and the
emotions of science and why these differences must be developed within a school district’s
curriculum.

Some of the key word/phrase indicators demonstrating a lack of comprehension that
emotions are the perception of biological conditions caused by cognition are: aberrant and
destructive emotions, emotional disorder, emotional regulation, emotional addiction, anger
management, “control your emotions” and “you are emotionally out of control.” These, as
well as depression, emotional trauma, and posttraumatic stress disorder (PTSD) need to be

_Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness_
(rev2020-01-23a)
Dear Board of Education: *Empowering ALL Students to Succeed and Thrive*

used with the understanding that emotions are a perception biological conditions caused by
cognitive activities. This construct is further developed in Section 3.0: “Depression: Mental
Illness of Mental Injury” of Symbiotic Psychology, the book

The success of our teachers in life – whether they are our parents, teachers and other
students in school, religious leaders, bosses at work, or the powerful academia, political,
and business leaders who set the stage for our lives – is in their ability to empower us with
the skills and abilities to think and to feel good, and to help us move our thought and debate
up into the mammalian brain. Here, a “what feels good is good” mentality can evolve into
broader and greater awareness of both short and long-term consequences and decision-
making and action can mature into greater complexity and imagination. With such
education and personal development, “what feels good is good” can have a compassionate
foundation for existence.

Enclosed is the current revision of Symbiotic Psychology: The Synergy Between Mind,
Body, Emotions, and Consciousness. And for an easy assessment by anyone, the book can
be downloaded at http://emotional-evolution.com/. Please feel free to contact me with any
questions or concerns you may have. This book was written to offer a basic understanding
of what is necessary within a K-12 curriculum that empowers ALL people – especially
those who are socio-economically disadvantaged – with the tools needed to, not only
survive, but thrive in today’s chaotic world of uncertainty, mis-information, and cultural
division.

Sincerely,

Andrew Jackson

http://emotional-evolution.com
https://symbioticpsychology.com/
Postscript:

There is a danger of medications masking destructive cognitive behaviors that normally are exposed through erratic, abnormal, and convoluted emotional feedback. If these emotional reflections of aberrant mental and physical behaviors are ignored or camouflaged with pharmaceuticals and if irregular cognitive behavior is left unaddressed without proper psychological counseling and therapy, cognition may fester unabated and create a myopic vortex of circular mental and physical behaviors. This psychosis can break out with disastrous consequences to the patient and to others, who may become characters in a manically-conceived tragedy played out in real life. (ref: Jackson, A., 2019. Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness. Section 6.2)

Emotions and Feelings: Nature’s Biofeedback Mechanism

Emotions and feelings are felt. Good and bad feeling emotions and feelings are the perception, by consciousness, of a biochemical physiology within the body and the brain precipitated by an evolved and nurtured cognitive neural circuitry. Because emotions and feelings are perceptions of an internal state of biology precipitated by cognition, emotions and feelings are a reflection of, and give insights into, the nature of said cognitive behavior. Also, because emotions and feelings are not causal, emotions and feelings are neither destructive nor constructive but rather they are indicators towards the presence of very real destructive and constructive – and causal – cognitive behaviors. Correlations between cognition, healthy biochemical physiology, and good feeling emotions and feelings are a result of millions of years of evolutionary survival for the health and well-being of the individual – as are the correlations between bad feeling emotions and feelings and an unhealthy biology. Now the question is, how are these correlations between cognition, biology, emotions and feelings, and consciousness understood, nurtured, and developed within a society for an individual’s health, wealth, and general well-being through their own successful decision-making and creativity?
Am I Me?

I am that which I am aware of. I am that which I am conscious of. Is it I who choose my thoughts and hence that which I feel? Do I determine who I am, what I am, what I do?

Or do “they”, those who wish my obedience? Do they orchestrate my mind, my thoughts, my attention, and hence, my emotions? Do they determine that which I am, that which I desire, that which I do?

Am I me or am I them?

Dear Student,

A person’s core beliefs of emotions – which may have been linguistically molded from childhood through family interactions and in later years through reading literary works such as Dickens’s *Great Expectations*, Poe’s *The Raven*, and Austen’s *Pride and Prejudice* – have created a false construct of emotions’ true reality. That is, emotions of a character in a story that drives them to love, to fight, or to conquer the world… are an illusion. Emotions simply don’t exist that way.

A character in a plot feels emotions. They have emotional feelings. They perceive emotions. Essentially, all emotions that a character feels are emotions that feel good or emotions that feel bad. But the bodily changes, the bio-chemical changes that a person feels in love, in depression, in the fight, flight, or freeze response such as a faster beating heart, a quickening of
Dear Student: For Entertainment Purposes Only

the breath, the perspiration running down their forehead, the knot in their stomach, all these bodily changes are not caused by emotions.

They are perceived. Yes. We call these perceptions emotions. Yes. But these changes in the body’s biology are not caused by emotions. No. These body changes are caused by the mind. Or to be more precise, these changes in biochemistry are caused by neurological activities within the cognitive mind.

What is the Cognitive Mind?
The cognitive mind deals with thinking – with thoughts of awareness and knowing. Cognition also deals with the processes of knowing, namely, perception, recognition, conceiving – which includes imagination and inspiration – and reasoning (Encyclopedia Britannica. Cognition: thought process).

A character in a plot perceives something out of place in the woods. They recognize some recently broken branches. They imagine that a bear came rumbling through looking for food. Their thoughts are later confirmed when they come across a thicket of brush with freshly ripened blue berries. And right in the middle is a very protective mother bear with her cubs.

Cognitively speaking, the character (1) perceived a bear with cubs. They (2) recognized it as a bear with cubs. And, they (3) conceived what it meant to intrude upon a mother bear with cubs. Then came (4) the bodily changes as result of these cognitive activities that are perceived as (5) emotions. What emotions did our character feel when they came across a bear and cubs in the woods? Much of what our character would feel depends on their past experiences. What are some different pasts that a writer might give to our character to interpret their situation? With that past, what bodily changes would be generated, perceived, and interpreted as what emotions?
Dear Student: *For Entertainment Purposes Only*

What are Emotions?

Emotions are a perception, a sense akin to the sense of sight, sound, taste, smell, and touch. The sense of emotion feels. Broadly speaking, emotions feel good or emotions feel bad. Emotions are a perception of the biochemical and physiological states of the body. And contrary to popular folklore and their characterization in a movie or novel, a person is not driven by their emotions.

A person may be driven, and they are driven, by their changing biochemistry. But these biological states are precipitated by cognitive activities, not by an emotional awareness. Emotions sense these biological states. Emotions don’t create them. Cognition creates them. And as a reminder, cognitive activities of the mind are awarenesses of knowing such as thoughts, perceptions, reasoning and imagination.

(Author’s Note: When a person perceives their own emotion, this perception is a cognitive activity which can lead to biological changes. But still, it is an awareness of emotions, a cognitive activity, that changes the biology, not emotions).

A script may have a character who is “emotionally out of control.” Technically that person is not “emotionally” out of control but “cognitively” out of control. They have lost control over their cognitive activities of thought, of imagination, of conceptualization. Their mind is running rampant. It is their thoughts and imaginations that are wildly changing the body’s biochemistry. It is these changes in biochemistry that makes the heart beat faster, the breath to quicken, the sweat to bead up and run down the cheek and the stomach to knot. These changes in bio-chemical physiology are what the character perceives as emotions.

Emotions as an Evolved Sensory Perception of Bio-chemical States

An observer has a perception of, and an understanding of, what it means to come across a hungry bear in the woods. To say the observer has an emotional reaction – or an emotional event – to the bear is true but it is also inaccurate. The observer had a series of cognitive...
events. They saw an animal. They recognized it as a bear. They imagined that the bear was hungry. They conceived of the idea of themselves as being the bear's dinner.

These conceptions brought about bio-chemical changes in the body. Maybe their heart raced, their breath quickened, they became agitated – they are having an emotional event – and they got the hell out of there. The bodily changes were not caused by emotions, bodily changes were perceived after the fact as emotions. It is not possible for emotions to be the both the cause and the effect. Fortunately, our observer survived to tell another tale.

Evolution is about retaining those characteristics and behaviors that enhance a being’s probability of survival by living long enough to pass these behavior patterns down to the next generation. Through millions of years of evolution, a specific relationship has evolved between mind, body, emotions and consciousness.

This correlative relationship is such that when the mind (1) thinks the body is strong and (2) the body actually is strong, (3) good feeling emotions are perceived by consciousness. This correlative relationship had to have developed this way or a being would tend to not survive very long.

Imagine what would happen to a person who is drunk and (1) thinks of themselves as strong and capable, but (2) actually they are quite confused and clumsy and (3) they feel great and very confident! They perceive themselves as quite capable of driving across town in rush hour traffic. What is their probability survival? (These arguments are developed further in Section 2: “Emotions as an Evolved Biological System” in the attached Symbiotic Psychology book.)

**A Feels Good Is Good Attitude**

A person’s emotions are indicators of their health and well-being. Emotions are telling them the harmony of their body’s biology – are they being strong or weak. Negative feeling emotions are the body’s way of saying “you are creating conditions within your body that will cause, if it hasn’t already, weakness, lethargy, clumsiness, and ineptness.” These conditions
Dear Student: *For Entertainment Purposes Only*

make the body ripe for illness and disease. Positive feeling emotions are the body’s way of saying “you are creating healthy, strong and vigorous conditions in your body.” Not only is the body ready to thrive in the external world, but its internal world has a greater capacity to fight off illness and disease.

This “bears” repeating.

By entertaining negative emotional thoughts, a person weakens their body’s biology. By entertaining positive emotional thoughts, a person strengthens their body’s biology. This correlation between mind, body, and emotions is that which must exist for homo-sapiens to have survived their evolutionary challenges. For your body’s health, “what feels good is good” and “what feels bad is bad”. (Reference Section 2: “Emotions as a Biological System” in the attached Symbiotic Psychology book)

Now a “feels good is good” attitude is fine if a person is living in a world of one. But they are not. A person must do more than find thoughts, actions, and behaviors that feel good for their physical health. They must find thoughts, actions, and behaviors that feel good for their physical health and feel good for themselves as a person living in a society. Driving in a fancy car and having expensive clothes to wear may feel really good but being thrown into jail for theft isn’t going to do their career any good – if not just plain destroying it. How does that feel?

There is more to say on this in Section 9.0: “Emotional Guidance – The Dark Side” of the attached Symbiotic Psychology book.

**Cognitive-Emotional Wisdom**

To have cognitive-emotional wisdom is to have the cognitive and emotional understandings and abilities to avoid acting from the lower platforms of despair, depression, and anger. These negative emotional places of being have evolved to signify a weakening of a person’s biology. This makes them easier prey to diseases, illnesses and prone to accidents and injury. (Authors Note: If these last statements are in doubt because I don’t provide any empirical evidence, set

*Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness*  
(rev2020-01-23a)
Dear Student: For Entertainment Purposes Only

up your own “mental” experiments and “conceive” some possible results. Look what Einstein
did with mental experiments. Or you can do some research for a class.)

Cognitive-emotional wisdom means to have the cognitive tools and agility to move up the
emotional staircase and to act from the higher platforms where good feelings of clarity, health
and vigor reside. Section 7.0: “Cognitive-Emotional Wisdom” of the attached Symbiotic
Psychology book discusses a variety of cognitive-emotional wisdom themes relevant to today’s
culture and society. These themes should make for some good debate among your classmates
and teachers.

Emotions have evolved to guide cognitive activities. Emotions have evolved to inform their
owner that cognitive activities are all and well or that cognitive activities need to change for
the health and well-being of the individual. Negative feeling emotions are telling a person that
their biochemistry is going out of harmony and weakening the body’s biology.

Negative emotions are akin to the “check engine” light on the dash of a car; “something is
going wrong.” Now should the light be “managed” or “controlled” because the light has a
“disorder” or “illness” and is being “destructive” and “aberrant”? Is that what the light is
saying? Should we cover it up or ignore it because it is too annoying? Should we “drug the
light” so it no longer is doing its job? Is the problem with the light? No. The “check engine”
light is saying something is going wrong within the engine. The problem is in our cognitive
“engine”, not in our emotional “light.”

Section 8.2: “Cognitive-Emotional Rehabilitation and Strengthening Exercises (Your
Superhero Toolkit)” contains the heart of a lifestyle that reinforces the synergies between
mind, body, emotions, and consciousness. Strengthening these relationships might just be the
advantage a student needs to succeed in today’s chaotic world of prejudice and misinformation.
Understanding and working these cognitive-emotional strengthening exercises are especially
important to those where these skills are not part of their home and cultural environment.
Dear Student: *For Entertainment Purposes Only*

**Emotional Entertainment vs Emotional Wisdom**

Every society and culture have their own forms of emotional entertainment. That is, they offer opportunities for a person to be taken on an emotional ride for the fun of it. Allowing a book, a movie, a show or some other form of entertainment to take a person on an emotional roller coaster ride is the essence of what entertainment is about. All is fine and good if these emotional ups and downs are for entertainment purposes only. And, most importantly, the rider can get off when they want to.

But what if a person cannot get off life’s roller coaster? What if there is no longer a choice? Instead of allowing their emotions to be taken for a ride, their emotions have been hijacked by life’s events and they can no longer manage life’s roller coaster. Maybe they never learned how – nor developed the skills – to use their emotional guidance to transform life’s roller coaster into entertainment.

Instead, they are caught within a living nightmare where suicide seems to be the only exit. Also remember, emotions are the perception of biological conditions caused by cognition. Therefore, it is not that emotions are no longer “under control” but that a person’s mental activities are no longer responsive to their evolved emotional guidance.

To have emotional wisdom means a person has the ability and is capable of focusing on those thoughts, ideas, imaginations, and observations that feel good, or simply, on what they want and desire. Emotional wisdom means to have the ability and capacity to use negative emotions – that signify cognitive activities dwelling upon that which a person doesn’t want – to help themselves identify that which they do want. Again, a person knows what they don’t want – which feels bad – so now use that awareness to “find a better feeling thought.” (Hickes, J. & Hicks, E., 2006) To have emotional wisdom also means to understand the difference between the cognitive construct of an emotional ride for entertainment, where one can get on and off, and the cognitive construct of emotional guidance, where one uses their emotions to guide cognitive activities. A careful distinction must be understood by every individual as to which cognitive construct of emotions is in play.
Are emotions being allowed to be taken for a ride for entertainment purposes? And with this construct, is it understood that, in actuality, it is the mind that is being taken for a ride? Or, should the construct of emotions as an evolved biological guide to manage cognitive activities be utilized? Every person needs to develop the cognitive dexterity, understanding, and capacity to change between “emotional entertainment” and “emotional wisdom”.

Entertaining mediums such as books, movies, shows, concerts as well as many other forms ask of one to suspend their evolved emotional construct that guides cognitive behavior towards that which feels good. When being entertained, one is asked to lay aside their emotional guidance and follow the roller coaster up and downs of the many characters and themes of the story being presented. All is well and good if a person then re-engages their emotional guidance once the entertainment is over.

Quick Review

There are two modes of emotional engagement or on how emotions are utilized by the individual. One is “emotional entertainment” and the other is “emotional wisdom”.

Within the mode of “emotional wisdom” a person engages their evolved biological emotional system to continually evaluate their cognitive activities. If their cognitive behavior feels good, a person allows the continuation of these activities. If their cognitive behavior feels bad, they use this emotional negative awareness as motivation to find – or even create – new thoughts, imaginations, and awareness that feel better. This process of “finding a better feeling thought” (Hickes, J. & Hicks, E., 2006) continues until they are feeling good again.

Within the other mode of “emotional entertainment” a person suspends their evolved emotional guidance and allows their cognitive activities to bend and sway with the meanderings of their cognitive activities. These states of being are usually allowed for entertainment purposes such as going to a movie, play, or musical concert. Other happenings include attending sporting events.
Dear Student: *For Entertainment Purposes Only*

events or reading a book. Or, how about skiing, golfing, swimming, biking...the entertainment list is endless.

Within all these activities, emotional guidance is surrendered allowing a person’s cognitive activities to flow and sway with the event. This unabated cognitive activity creates an influx of various neurological and bio-chemical events paving the way for an emotional roller coaster ride of emotional hyper-activity. All is well and good if a person can get off the ride and reengages their emotional wisdom where cognitive activities are evaluated, sorted, and culled, accentuating the feeling good and emotionally positive awarenesses.

Note: Emotional guidance and emotional wisdom are very similar cognitive constructs. Emotional guidance refers to using one’s emotional system to evaluate cognitive activities. Emotional wisdom implies the use of emotional guidance plus a growth and awareness of various complexities of social order and disorder. This implies the importance and need for moral awareness, development and education. The importance of moving this internal discussion and debate up from the reptilian brain and into the mammalian brain cannot be over emphasized. See Section 7.0: “Cognitive-Emotional Wisdom” and Section 9.0: “Emotional Guidance – The Dark Side” in the attached *Symbiotic Psychology* book.

**Tyrannosaurus, the “Tyrant Lizards”**

Humans have evolved to be joyous beings. The evolutionary nature of emotional guidance is to sift through any mental turmoil to find, develop, and create the thoughts, beliefs, and behaviors that feel good. These good feeling behaviors are the indications of promoting a healthy and strong biochemical environment. But when the construct of emotional guidance is vacated, leaving only a construct of emotional entertainment, “reality” becomes a theatrical set that must be manipulated.

Instead of the relative ease of guiding one’s own mind to find emotional stability, it becomes necessary to manipulate “the play” and all those who make their entrances and exits. Life becomes a task of gigantic proportions that demands power and tyranny to control and direct.

*Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness*  
(rev2020-01-23a)
others. Life has now receded back to the land of the dinosaurs where a feels-good-is-good
morality has a very limited understanding and where “my” might makes “me” right.

We have the remnants of a biological brain that evolved into one of the greatest and most
powerful beasts that ever lived on this planet, the reptiles, the dinosaurs. Our reptilian
relationship now makes for a metaphor for quick and reflexive action without much thought.
Our “reptilian brain” is of this nature…. Don’t think…. Be aware…. Act. This behavior is vital
in sports and war where any delay to contemplate and understand may delay any action needed
for success. If it feels good, it is good. Might is right.

There are those who bring this type of “warfare” to the classroom, hallways, and playgrounds.
These tyrannosaurs or ‘tyrant lizards’ of the school dominate their environment because their
reptilian mentality has taken over their higher functioning mammalian brains. They react to
the environment in a constant “emotional entertainment” mode rather than act upon the
environment with “emotional wisdom.”

The world makes them rather than they make the world. What is seen makes them angry,
happy, sad, or whatever. What is heard makes them angry, happy, sad, or whatever. What
somebody else did makes them…. There is no engagement of “emotional wisdom”. They have
fallen into a trap where all the world has become emotional entertainment. They have become
victims of their lower order functions which now needs to control its environment. They need
to direct their play. They need power to direct and to manage each scene in their play because
all the world has become the cognitive construct of “emotional entertainment.” If I feel good,
it is good. If I feel bad, it is bad. My might makes it right.

For these tyrannosaurs, feeling good no longer comes from cerebral efforts of the mind to seek
and choose good feeling thoughts and then to act from this good feeling awareness. To the
tyrannosaurs, feeling good only comes from being “emotionally entertained.” This means they
need to control their environment so where any observation of their “playground” feels good.
And if it feels good, it is good. Might is right because might is needed to make their

_Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness_
(rev2020-01-23a)
Dear Student: *For Entertainment Purposes Only*

playground right. There is no longer a higher order of thought where any complex discussions and understandings may pave the way for a “might for right” code of justice.

These “tyrants of the playground” may yet serve a purpose for those educated to understand. These tyrants of brutality and violence as well as those who create anxiety, worry and trepidation can be useful. They provide a cerebral challenge and field experience in finding one’s own internal values, beliefs, and detachment that disempowers the tyrannosaurs’ aggression. Success comes from detaching from the tyrant’s reality and the tyrant’s belief of their dominance and control. Success comes from detaching from their “Jurassic” world by creating and acting within one’s own world with one’s own thoughts, beliefs and rules of engagement. (Actually, the age of dinosaurs is the Mesozoic Era.)

There are other tyrannosaurs whose realities may oppress with sadness by drawing a person into their vortex of sorrow and unhappiness. Like an undertow from waves breaking on the shore, their reality of oppressive thoughts and beliefs can suck a person down to their demise. Or, there are those tyrannosaurs who are “impossible people in positions of power” (Castaneda, 1984) who make a person rage with anger and violence. All of these “tyrant lizards” provide an opportunity to practice detachment.

The concept of detachment means to detach from the realities of their world and to create the realities of one’s own world. Detachment demands that a person finds, create, and focus on their thoughts, beliefs, and attitudes that empower their freedoms, understandings, and values of their own new world reality they wish to inhabit.

**Evolving Out of the Age of the Tyrannosaurs**

Neuroplasticity is a term used to describe the brain’s plastic ability to rewire itself, to reconfigure itself. “Truths” and what “is real” and the “way it is” that is supported by a network of nerves in the brain and body – called a neurological network – can change. The neurological networks that are needed to support the reality of the tyrannosaurs can change so that their world need no longer exist in your world. This is detachment.

*Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness*  
(rev2020-01-23a)
Dear Student: For Entertainment Purposes Only

When the neurology changes that supported the age of the tyrannosaurus cease to exist, all their truths about “what is real” and “that is the way it is” cease to exist. The reality of yesterday is no longer real today. Through effort, understanding, and use of an evolved biological emotional system these old “truths” of what is “real” and the “way it is” that demanded a specific behavior of survival in a “Jurassic” existence, no longer exists. This is detachment.

Thus, once detached, the necessity of “their” survival behavior also ceases to exist. Welcome to the new era of the “mammalian brain” where might is for righteousness. The greater capacity of the mammalian brain supports a more complex and sophisticated neurology. This evolved mammalian neurology supports a more complex thought, understanding, and behavior which are guided by an evolved biological emotional system.

Get Off the Ride, The Show is Over

The emotional roller coaster ride of a show, movie, or book is entertaining. But when the show is over, when the ride is over it is time to re-engage the emotional guidance system. This means using emotionally negative cognitive activities to identify emotionally positive cognitive activities and then to move on to the emotionally positive. It means reinforcing an internal neurological world that accentuates the positive and negates the negative.

Those who don’t get off the ride and re-engage their emotional guidance system are like a ship without a rudder and is at the mercy of the greatest winds and the largest waves. They are subjects to the forces of tyranny around them. They are not master nor commander of their fate.

The Tyrannosaurs Rex

Superhero characters in movies, comics, and books save the world, but are they disempowering their audience? The superhero ride, if it stimulates within a feeling of strength and power then the ride does serve their audience and provides for a touchstone emotion to strive for as an individual. But, if the superhero ride accentuates the need for somebody outside of one’s self

A Student’s “I” Team of Superheroes: Mind, Body, Emotions, and Consciousness

12. Are today’s students honoring the millions of years of evolution that make up their heritage?
13. Mind, body, emotions, and consciousness have evolved together to work together as a team.
14. This is the “I” Team. Education may be strengthening a student’s cognitive abilities, but are
15. students developing the superpowers of their “I” Team? Are your mind, body, emotions, and
16. consciousness learning how to work together in synergistic harmony?
17.
18. Today’s humanity is the product of millions of years of successful evolution. Billions upon
19. billions of beings have succumbed to a stronger foe, leaving only the strongest. Yet now
20. standing on that mountain top, will they falter? Humanity’s heritage is one of strength,
21. power, stamina, reflex, cunning, and wisdom. This is their nature. The professional, the
22. victorious, the successful, the prosperous have all tapped into this reservoir. How about the
23. multitude? Is education providing the knowledge, skills and abilities to unleash a person’s
24. evolutionary-self that holds their strength, power and success?
25.
26. *Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness*
27. For anyone to succeed in this life they must develop their own superpowers. They must
28. become their own Superhero. They must take charge of their own education because,
29. unfortunately, their formal education, as yet, does not provide the tools and training they need.

*Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness*
*(rev2020-01-23a)*
Dear Student:

I wrote *Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness* in order to give everyone the theory and understanding necessary to take charge of their own lives and to comprehend and use their own abilities to empower themselves. The most important reading to understand is Section 8.2: “Cognitive-Emotional Rehabilitation and Strengthening Exercises (Your Superhero Toolkit).” Here is a list of exercises or areas that a person as an individual can exploit and empower themselves to success.

Some people are born into a world that inherently teaches these skills and abilities. Unfortunately, their “social capital” seems to leave little understanding and compassion for those born without those same privileges and understandings. This letter has been a letter of encouragement for each student to start taking responsibility for their own education. As an adult each person will become responsible for their own conditions even if they don’t have the cognitive-emotional training to be responsible. A person is just a leaf blown helter-skelter by the winds of events if they are not aware of their evolved emotional guidance. Everyone does their best with what they have. If society demands more of their citizens, society must then empower their citizens with the tools to do and be more.

Personally, I believe schools do not teach the skills to do and to be more is because the powers and beliefs of the tyrannosaurs are not extinct. To be empowered is to build a new life and a new house of prosperity, justice, and freedom. The time has come for each student to build their own house. The time has come to create a house for their family and loved ones. The time has come to create a house, based not on tyranny, but on love. That house is called a home.

The *Symbiotic Psychology* book is divided into four parts. **Part 1: Letters** is composed of letters, like this one, to introduce and promote *Symbiotic Psychology* to a variety of socio-economic groups. **Part 2: Theory** is just that, the theory of how and why *Symbiotic Psychology* works. **Part 3: Practice** provides for opportunities on how to apply *Symbiotic Psychology*...
Dear Student: For Entertainment Purposes Only

Part 4: Essays are some of my writings to promote how Symbiotic Psychology creates a different perspective of the world. I can only wish each reader good luck. I have provided and explained the tools of success to the best of my ability. Everyone must do their homework. Not I, nor anyone else, can take this journey for the other. It is each person’s journey to experience in their own special and unique way. Make it a good one.

Sincerely,

Andrew Jackson

Subject: Unleash Your Evolutionary-Self of Strength, Power, Cunning, and Success

Date: 2019-07-16a

Dear Athlete,

You are the product of millions of years of successful evolution. Billions upon billions of beings have succumbed to a stronger foe, leaving only the strongest. You now stand at the top of that mountain. Your heritage is one of strength, power, stamina, reflex, cunning, and wisdom. You have all that within you. The professional, the victorious, the successful, the prosperous have all tapped into this reservoir. How about you? Do you want to know how to unleash your evolutionary-self that holds your strength, your power and your success?

Athletes have worked for years, with thousands of hours of practice building their mental and physical strength, stamina and dexterity. Yet, with all that, there is something more. That something is the synergy that can be had when mind, body, emotions and consciousness are working in harmony.

I wrote the enclosed book, Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness for athletes to understand how mind, body, emotions, and consciousness work as a team. Each system is the result of billions and billions of conquests where only the strong, the powerful, the cunning, the clever and the wise have survived. The time has come for each athlete as an individual to tap into that wealth of power that lies quietly, silently – dormant – within everyone.

The “I” Team: Mind, Body, Emotions, and Consciousness

The mind, body, emotions, and consciousness have evolved together to work together as a team. This each athlete’s “I” Team. An athlete is physically strong, but ate they “I” Team strong? Is their mind, body, emotions, and consciousness working together

---

*Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness* (rev2020-01-23a)
Dear Athlete: *Unleash Your Evolutionary-Self of Strength, Power, Cunning, and Success*

in harmony? Are they honoring the millions of years of evolution that make up their heritage?

The key to understanding the harmony between mind, body, emotions and consciousness is to understand what emotions exactly are. Emotions are an individual’s conscious perception of their body’s biochemical balance created by the cognitive activities of the mind. Emotions are not just something that feels good or feels bad, although that becomes a very important distinction.

An athlete’s emotions have an evolved relationship with their mind and body such that when they think they are strong and their body actually is strong, their emotions feel good. Different emotions are perceiving different bio-chemical conditions of the body such that as an athlete continues to feel good, their body’s biology will be good. (Reference Section 2: “Emotions as an Evolved Biological System of the Symbiotic Psychology book.)

An athlete’s emotions are indicators of their health and well-being. Emotions are telling them that the harmony of their body’s biology is becoming strong or weak. Negative feeling emotions are the body’s way of saying “you are creating conditions within your body that will cause, if it hasn’t already, weakness, lethargy, clumsiness, ineptness and sickness.” Positive feeling emotions are the body’s way of saying “you are creating healthy, strong and vigorous conditions in your body.”

By entertaining negative emotional thoughts, an athlete is weakening their body’s biology. By entertaining positive emotional thoughts, an athlete is strengthening their body’s biology. This correlation between mind, body, and emotions is such that must exist for homo-sapiens to have survived their evolutionary challenges. (Reference Section 2: “Emotions as a Biological System”) For your body’s health, what feels good is good and what feels bad is bad.
Dear Athlete: *Unleash Your Evolutionary-Self of Strength, Power, Cunning, and Success*

Now a “feels good is good” attitude is fine if a person is living in a world of one. But they are not. A person must do more than find thoughts, actions, and behaviors that feel good for their physical health. They must find thoughts, actions, and behaviors that feels good for their physical health and feels good for themselves as a person living in a society. Driving in a fancy car and having expensive clothes to wear may feel really good but being thrown into jail for theft isn’t going to do an athlete’s sports career any good – if not just plain destroying it.

**Don’t Confuse Physical Pain with Emotional Pain.**

A pulled muscle, a strained knee or a bruised hip are just some minor injuries most athletes are probably are well acquainted with. “No pain, no gain” may make sense with developing your physical prowess. But what about emotional pain? What does emotional pain mean? Should an athlete just ignore it and hope it will go away? Maybe. But that is developing emotional ignorance and an ignorance to their body’s health, harmony, and well-being.

It is far better to be emotionally aware and to consciously take steps to maintain an emotional sense of well-being. One may just have an “emotional bruise” that will heal easily. But just as physical trauma is serious business, emotional trauma must be understood and be carefully nurtured. (ref. Section 7.2: “Trauma and Addiction Corrupting the Cognitive-Emotional Relationship” of the *Symbiotic Psychology Book.*)

Negative feeling emotions are an athlete’s body’s signal that “you are screwing up.” Mind and body are getting out of sync. Biochemically, something is going out of harmony. Maybe an athlete’s coordination will be off which affects their timing and therefore their muscles won’t be doing exactly what they thought they would/should.

The ways and means of evolution tend to eliminate those who don’t respond to their emotional systems. In sports, those who don’t attend to their emotional signals may
Dear Athlete: *Unleash Your Evolutionary-Self of Strength, Power, Cunning, and Success*

be left with their shot, their kick, their swing, their vault, their “whatever” looking like a rookie. The “air ball” in basketball is a great example. So is a missed field goal in football, a missed goal in soccer and a bad putt in golf.

*What you saw was mis-perceived.*

*Therefore, your aim was mis-conceived.*

*Your muscles were deceived,*

*because your emotions were not believed.*

With the presents of emotional pain or emotional trauma, an athlete is more likely to get injured. Something – whether it’s their muscles, nerves, the senses like perceptual awareness, or ‘whatever’ – something is not working in harmony. The “I” Team is in trouble. When an athlete is in competition and pushing themselves to their limit…when they are putting tremendous load and pressures and heavy demands on their body….when they need all of their parts working together in harmony….what are ANY unresolved negative emotions going to do to upset one’s performance? How bad are these unresolved negative emotions going to affect an athlete’s power, strength, cunning or awareness?

Emotions mean something. Negative emotions mean, “Something is NOT working together! Something is NOT in harmony as it was before! Something – we don’t know what – is going to give!” BLAM! POW! SNAP! And they are out for the season. Their emotions were telling them something wasn’t quite rights.

Will you listen to your “emotional speak” now?

*Make right your emotional might;*

*without that light there ain’t no sight.*

*Tonight… fight smoke tonight*

*OR Tonight…. Be Smoke tonight!*

*Emotional pain – ain’t no gain!*

*Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness*  
*rev2020-01-23a*
Dear Athlete: Unleash Your Evolutionary-Self of Strength, Power, Cunning, and Success

Ain’t no gain with emotional pain.

Being Emotionally Strong Means Being Emotionally Aware and Wise

Do the pressures of the next challenge make an athlete reach into their evolutionary soul to bring forth all their power, strength, courage, and stamina? Is there so much excitement and anticipation to keep still? This is the emotionally positive what-if-game. In fact, there is no what-if with such excitement and anticipation, there is only this is “my game.”

Or, have an athlete’s thoughts turned them numb to where their brain is no longer working? Has the spectacle of the event made the brain – like a pinball machine gone “TILT” – unresponsive and unable to compete? Are their thoughts creating nervous energy to the point that they can’t sit still, not because of excitement, but because of nervousness and fear? Are they focusing on an emotionally negative what-if-game?

An athlete’s power comes from being and maintaining an emotional state of feeling good. Negative emotions are also wonderful. They have their place. They are telling a person exactly what they do not want. But don’t stay there dwelling on what is not wanted. Make a diamond out of the charcoal. Use that negative emotion to find thoughts and actions that feel good and go there! Go to where your power and strength are.

Section 8.2: “Cognitive-Emotional Rehabilitation and Strengthening Exercises” outlines a list of tools and exercises to use and to get off the mentally negative weak and onto the mentally positive strong. Emotions are like a perpetual coach signaling which is which. These are an athlete’s Superhero exercises to get their mind and emotions working together as a synergistic whole. Synergy is where 1+1 = 3 or 5 or even a lot more. The greatest athletes get to a place where their mind, body, emotions and consciousness work as a synergistic whole. These athletes become the MVP because they became greater than themselves.
Dear Athlete: Unleash Your Evolutionary-Self of Strength, Power, Cunning, and Success

A Prevent Strategy Is a Losing Strategy

A prevent defense, a prevent offense, a prevent anything-fence usually means somebody is focusing on something they don’t want to happen. A prevent strategy means a person is trying to prevent something from happening (focusing on what they don’t want) rather than making something happen (focusing upon what they do want).

When focusing upon what they don’t want – when negative emotions are present – they are weakening the synergistic harmony between mind, body, emotions, and consciousness. To maintain synergy, a person must focus on what they want.

Don’t prevent what you don’t want. Make happen what you do want!

What is your “prevent offense/defense” in your sport where you are weakening your physical and mental abilities and laying the foundation for defeat? What emotional shadow do you leave lurking around because “it’s not a big deal?” It is a big deal. What shadow are you not paying attention to? What lingering thought are you ignoring that eventually may lead to your downfall?

- Maybe your downfall will come from nagging thoughts of an old injury.
- Maybe competition brings forth garbage and conflicts and instead of being fun and exciting, competition is misery and pain.
- Maybe a recent argument with a girlfriend or a divorce will trip you up.
- Maybe you and your fans are still celebrating beating the undefeated, number one team in the nation in the semi-finals while your next opponent – in the finals – is busy preparing to beat you.
- Maybe your fist game of the season is with a “cupcake” and while you are just “going through the motions, your “cupcake” is tapping into their power, strength, cunning, and success of their evolutionary-selves by working hard and by putting all their focus and energy into beating you!
Dear Athlete: *Unleash Your Evolutionary-Self of Strength, Power, Cunning, and Success*

- What unresolved shadow is waiting to take you off your game?
- What shadow is lingering in the dark?

Resolve those hidden shadows by using them. See these issues as the charcoal that brings forth diamonds. They tell a person what they don’t want. Now each athlete must do the work to find and then focus on what they do want; and make diamonds. When a person is succeeding, they will feel the positive feeling emotions that strengthens the synergistic harmony between – and within – mind, body, emotions, and consciousness. But it takes the heat of a great battle to really get the thrill and excitement of that good feeling energy flowing through your veins and into your desire for a victory.

Check out another type of strengthening exercises in Section 8.2 of the Symbiotic Psychology book.

**Becoming a Master: Understanding Yourself as an Opponent**

The real game, match, meet, challenge is with yourself. You are your real opponent. Are you dwelling upon what you want, or what you don’t want? Are you strengthening and unleashing your “I” Team or not? Your emotions will let you know. Your emotions are telling you if you are creating a synergy between – and within – your mind and your body…or not.

Now is the time to include emotional awareness and transformation training with your physical and mental training. Here, winning means you are finding your heritage, your evolutionary-self of strength, power, stamina, reflex, cunning, wisdom and the success that comes with pivoting off of negative feeling emotional awareness and onto positive feeling emotional awareness.

Each and every time you succeed in using an emotionally negative feeling thought to find and to move into an emotionally positive feeling thought, is a very important

*Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness*  
(rev2020-01-23a)
Dear Athlete: *Unleash Your Evolutionary Self of Strength, Power, Cunning, and Success*

victory. Celebrate every emotional transformation. Transforming negative emotions into positive emotions is your most important victory.

By getting off the emotional pain-train, you will reconnect with your evolutionary-self and the synergy that lies within. The synergy between mind, body, emotions and consciousness will unleash a new and greater strength, power, stamina, reflex, cunning, and wisdom.

This is your evolutionary heritage. This is your evolutionary-self. This is your “I” Team. This is you.

Good Luck,

Andrew Jackson

Postscript:
I invite you to read Section 8.2: “Cognitive-Emotional Rehabilitation and Strengthening Exercises” and especially Section 8.2.7: “Sports” where you can find a variety of methods for empowering your emotional game. I also wrote Section 7.7: “The Wisdom of a Champion: Let Joy Reign” and Appendix (A): “Nets on Fire: Making the Air Electric” to give you a better feel for your emotional game.
Subject: Justice Founded Upon Falsehood Is Itself False and Unjust

Date: rev2019-08-04a

Dear Friend,

Justice within our courts is founded upon a false psychology of emotions. Punishment guidelines are erroneous because current comprehension of punishment is based upon an erroneous understanding of emotions within human psychology. Also, the statistics of recidivism that exist only exist because of this ill-founded knowledge of human behavior. Punitive requirements cannot be based upon these statistics because punishment and recidivism based upon a different psychology – one that accurately portrays human biology – will create different statistics. Current statistics now based within a mistaken psychology cannot reflect behavior grounded within another, more accurate psychology.

Current justice, punishment, and recidivism are based on a psychology of behavior where emotions drive biological change and subsequent behavior. This is a false premise. Emotions perceive biological changes precipitated by cognitive activities. Behavior doesn’t follow emotions, instead, behavior follows cognition. The power of a consciousness lies within its choice of cognitive activities – thoughts, imaginations, observations, and rationale. True justice empowers consciousness to wisely choose its cognitive activities – from which outward acts of behavior germinate and sprout.

A justice of punishment for a crime is inhumane because of a lack of intention to change a person’s cognitive behavior. Or is that not the goal of justice? Should justice be defined as punishment with an intent to inflict pain, suffering, or hardship upon an individual? Or, should justice be defined as an intent to impower cognitive behavior for the health and well-being of the individual and society? Should our criminal justice system be an extension of “an eye for an eye” or is justice served by entrusting individuals with the training, skills, and understandings to make better choices for themselves and others throughout their life.
Dear Friend: Justice Founded Upon Falsehood Is Itself False and Unjust

Current human behavior modification is based within an erroneous psychology of emotions. Also, punishment as “justice” for a crime denies the science of neuroplasticity. Neuroplasticity is a concept where the brain rewires itself. This rewiring results in new interpretations of old awareness. Thus, a reality that once manifested criminal behavior no longer exists. What is justice if conditions that once encouraged criminal behavior can no longer exist? What is justice when circumstances that led to criminal behavior can no longer exist?

Within the text, Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness, you will find the necessary tools to forge a new identity and to recreate a new life. You can right society’s erroneous behavior for yourself and others who have befallen your fate if you listen carefully to the words within the following pages:

1. Letters: Letters: Dear Prisoner (of War)
2. Section: 1.3: “The Five Postulates of Symbiotic Psychology”
3. Section 7.4: “Criminal Justice Reform”
4. Section 8.0: “Cognitive Emotional Therapy”
5. Appendix (B): Criminal Law and Justice Lagging Psychological Advancements

Your scalpel to dissect and to lay aside the flaws within contemporary “justice” lies within the scientific concept of neuroplasticity. Neuroplasticity is a scientifically proven concept – that can be taken to court – which outlines how the brain can rewire itself and form new realities. That is, what was real yesterday, may not remain real tomorrow. A person has the physical attribute to change and to be different than the person which committed a crime.

Our criminal “justice” system not only does not recognize this possibility but creates conditions to inhibit and retard any possibility of individual neuroplastic transformation. Can that not be defined as “cruel and unusual punishment” from which the Constitution protects us all from?
Dear Friend: *Justice Founded Upon Falsehood Is Itself False and Unjust*

A law based upon illusionary science is delusionary and denies a person’s Constitutional protection to be free from cruel and unusual punishment.

In order to use the concept of neuroplasticity to repeal inhumane “justice”, the illusionary beliefs of emotions driving behavior must be dispelled. Emotions are an evolved sensory system designed to be used by consciousness to guide internal cognitive behavior and external physical action. This new paradigm – where emotions are an evolved biological sensory system that perceives biological changes precipitated by cognitive activities- is developed in Part 1: “The Theory of Symbiotic Psychology” of the text *Symbiotic Psychology: The Synergy Between Mind, body, Emotions, and Consciousness*.

I am thankful that your hardships have forged an intentional life towards yours and society’s health and well-being. Criminal justice should reinforce the conditions that reinforce this outcome. A criminal justice based upon punishment and hardship is unjust. Someday, maybe the society and the courts will understand this.

This letter is to help you on your journey. I can only provide a vague outline of your path to justice. It is up to you to embody the ideals necessary for change and for you to gather the resources you need, and if you so wish, to bring your appeal to trail.

I am available to help where I can. A complete text for anyone to download and use can be found at: [https://emotional-evolution.com/](https://emotional-evolution.com/) or [https://symbioticpsychology.com/](https://symbioticpsychology.com/).

Sincerely,

Andrew Jackson

Subject: *Escape from Alcatraz*

(rev2018-04-13a)

Dear Prisoner (of War),

POW is traditionally a designation for those captured and retained within a military campaign of a war in the traditional sense. But there have been no declared wars by the United States since WWII. Yet many of our military personal have suffered, died, and have been captured in undeclared wars ever since. I offer no disrespect to all those honored heroes. I am acknowledging another war, the war beneath the surface from which all military campaigns emerge as well as the undeclared war waging in our streets every day.

Within this war there is a conflict of ideas and beliefs. Within our society punishment is seen as “justice” for a “crime.” Punishment is not justice. It is not The Truth. Crime and punishment for a crime are but a socially accepted concept fabricated to control a ‘lesser’ people. It is an idea and a belief given an illusion of validity and power to dominate and enslave a ‘lesser’ culture. I am writing to you to help you break this illusion of acceptable behavior of a society that has fallen into a coma.

Punishment is not justice because we all have within our brains the neuroplastic capacity to change, grow, and realize a new reality where we feel and are eventually treated as a better person than we are now. There is a war of cultures. One is an ideology that believes in self-righteous power and domination over a “lesser people of God” and which will manipulate and twist any ideology to advance their dominion. Their desire is to subjugate another ideology that believes in empowering and raising up all peoples of this planet because we all are children of God with the rights of life, liberty and the pursuit of happiness.

You are within a war of ideologies. One ideology teaches how to love and embrace humanity so that we all may enjoy this life on this planet. The other ideology does not care about other people and beings. It sows hate and fear that we wage violence upon each other.
Dear Prisoner (of War): Escape from Alcatraz

It is a belief that the spoils of this planet are only for the favored and deserving few. You are a prisoner of an undeclared war and I honor your faith and belief in a better world. You are in a fight to the death because only one reality is triumph within your heart. Which reality will you embrace, and which reality will you let die?

We need to stop squabbling among ourselves for that is their desire. Who are ‘they’? ‘They’ are the tyrants in our circle; the circle of reality we have created and are now living. They are the ones who dominate us and plant the beliefs of violence and torture that we must suffer and die. ‘They’ are the ones who wish us to give up and become one within their circle of aggressors. We need to stop the squabbling within ourselves for ‘they’ are also the ideals, beliefs, and values that live inside our minds. ‘They’ are also us. Look at those walls and bars around you. Do you see a prison, or do you see playground? These tyrants can be our greatest allies and teachers, our keys to freedom. Or, we can join them in our greatest defeat and become one of their instruments of lies and deceit.

This is guerrilla warfare…. you are on your own. There is no society to save you, no superhero to break down your prison walls and stamp out your oppressors. You must be your own superhero. You must stop accepting the validity of ‘their’ justice and ‘their’ definition of who and what you are. You must be the creator of greater justice and no longer be a victim of unlucky circumstances. Become the creator you were born to be. Create your life of liberty and pursue, not your anger, not your jealousy, not your envy, but pursue your happiness and joy. Joy is your true inheritance that exists for you. But you must believe in it and claim it as yours.

I would like to say I’m sorry you are in here. It’s not where you want to be. But it is where you are. I hope these words I am writing will make your life easier for you. When I was in El Paso County Jail, trying to make the best of a bad situation, you know, making lemonade out of lemons, my wife began telling all her friends, “he likes being in there.” But you must make the best of a bad situation. You must make the best of the cards you are dealt. She came to visit me…. once….to have me sign a paper saying I was ‘mentally unstable’ and at
the same time said she was getting a divorce. A guy would like a little sympathy from his
wife, but it may not come. I came to El Paso, TX because she got a good paying job there…
All the sympathy I was getting for helping out her career was a few ‘tenderizing moments’
from my friends in blue and an inmate friend of mine.

That was another lifetime, another life I was then living. It all changed when I took
responsibility for my life. My circumstances for being in jail were not my fault, but they
became my responsibility. As long as I was a victim, as long as I got angry and blamed ‘God
knows who…’, as long as I looked everywhere but within my own heart and soul, I was
going to remain in prison…

I am now looking out my window at a cold Wisconsin winter’s end. It is cloudy, and the
leafless trees make a bleak silhouette against the gray and dark sky. I love the freshness of
the cold and the brilliant whiteness of winter’s snow and the stillness of our frozen lakes. It is
a very quiet time of year, a time of hibernation, but also a time of exhilaration. Spring will
be here soon, and everything will be turning green, the leaves will be coming out and the
birds will be returning with their happy songs of cheer…. I am happily married. We met in
the want ads about 18 years ago. Life did get good for me. I got out of jail, cured my
‘mental instability’ and I have been having some good times boating on the water, watching
football and having barbecue cookouts with my friends. I changed my life and if you listen
closely, you will walk out of that cell and find your own good times with friends and
family…. I will share with you a plan, a path on how you can escape from the worst of
prisons, even those worse than the infamous Alcatraz…those within your mind.

Sincerely and with love and respect,

Andrew Jackson

Part 2:
The Theory of Symbiotic Psychology

*Emotions and Feelings: Nature’s Biofeedback Mechanism* .................. 139
1.0 Symbiotic Psychology .......................................................... 141
2.0 Emotions as an Evolved Biological System .............................. 151
3.0 Depression: Mental Illness or Mental Injury .............................. 157
4.0 Cognitive/Emotional Rehabilitation ........................................ 161
Emotions and Feelings: Nature’s Biofeedback Mechanism

Emotions and feelings are felt. Good and bad feeling emotions and feelings are the perception, by consciousness, of a biochemical physiology within the body and the brain precipitated by an evolved and nurtured cognitive neural circuitry. Because emotions and feelings are perceptions of an internal state of biology precipitated by cognition, emotions and feelings are a reflection of, and give insights into, the nature of said cognitive behavior.

Also, because emotions and feelings are not causal, emotions and feelings are neither destructive nor constructive but rather they are indicators towards the presence of very real destructive and constructive — and causal — cognitive behaviors. Correlations between cognition, healthy biochemical physiology, and good feeling emotions and feelings are a result of millions of years of evolutionary survival for the health and well-being of the individual — as are the correlations between bad feeling emotions and feelings and an unhealthy biology. Now the question is, how are these correlations between cognition, biology, emotions and feelings, and consciousness understood, nurtured, and developed within a society for an individual’s health, wealth, and general well-being through their own successful decision-making and creativity?

Andrew Jackson

2018-03-23
Rev2020-01-23
1.0 Symbiotic Psychology

The physical pain of a hand on a hot stove brings about a very natural reflexive response: the pain is a signal to get the hand off the stove. The feeling of pain is significant to the health and survival of the body. A person cannot perceive the pain of putting their hand on a hot stove without first putting their hand on the hot stove. It is the hot stove that is altering the biochemical physiology of the hand, which consciousness perceives as pain. The

Likewise, a person cannot have an emotional response to an accident of a person injuring themselves in a table saw without first having an accident to be perceived. The accident must occur first, which is then perceived and cognitively digested by the brain/mind, which in turn activates biochemical physiological changes within the body. It is these changes in biology, which consciousness then perceives as emotions.

How is an emotionally out of control person emotionally out of control? If a person is having a fit of rage, or acting out in anger or commits a crime of passion, are they being emotionally out of control because their emotions are controlling cognition and physiological/biochemical behavior or is are they being cognitively out of control because cognitive activities are creating physiological and biochemical changes, which consciousness then perceives and calls emotions?

Emotional events do not occur without any physiological biochemical changes. To have an emotional event, there must first exist correlative biochemical change events within the body and these biochemical events in the body are initiated by activities within the cognitive neural networks. Since emotions are the perception of physiological biochemical changes triggered by cognitive events, being emotionally out of control is a false construct of the mind. It is not possible that an emotional event can precede its correlative cognitive event. Therefore, a person who is said to be emotionally out of control is in fact cognitively out of control and any emotional disorders must first be understood as cognitive disorders.
1.0 Symbiotic Psychology

Emotions are the perception, by consciousness, of a biochemical physiology precipitated by cognitive activities of our evolved and nurtured neural circuitry. Because emotions are perceptions of a state of biology being precipitated by cognition, emotions reflect and give insights into the nature of cognitive behavior. Emotions are neither destructive nor constructive but rather they are signals of the presence of very real destructive and constructive cognitive behaviors.

Correlations between cognition, biochemical physiology, and good and bad feeling emotions are a result of millions of years of evolutionary survival for the health and well-being of the individual. Now the question is, how are these correlations between cognition, biology, emotions, and consciousness understood, nurtured, and developed within our society for individual health, wealth, and general well-being through their own successful decision-making and creativity?

Symbiotic Psychology uses the theory of evolution to develop an argument that there are fundamental and necessary correlations between (1) the mental activities of cognition, (2) the body’s physiology and biochemistry, (3) the emotional perceptions of feeling good and feeling bad, and (4) consciousness. An understanding of these correlations reveals an emotional neural circuitry designed to perceive all cognitive activity in terms of a healthy/unhealthy biochemical physiology. Because an emotional event follows its correlative biochemical/neurological event, consciousness cannot regulate or manage emotions directly. Consciousness can regulate and manage cognitive activities which consequently initiate physiological and biochemical changes that are then perceived as emotions.

Section 1 of this book addresses the power and extreme usefulness of understanding how emotions are a perception of biochemical/neurological physiology and an evolved emotional guidance system for consciousness to evaluate and modify cognitive activities. It is this understanding that is so important for the mental health community. This aspect of an evolved emotional guidance system must be incorporated into psychological and
pharmaceutical therapy as well as into every day personal usage for the health and well-being of an individual.

However, awareness of emotional conditions is another awareness of cognition…. which can form a circular feedback loop. This feedback, if left unabated, can continuously repeat upon itself with the outcome that the feedback is more dominant than the original awareness. This is similar to the distortion that can occur in a repetitive feedback loop between a microphone and a speaker. Here cognition is a response to emotion, that is, emotions are generating a feedback loop in which cognition is incorporating into its original cognitive activities giving the illusion that emotions, rather than cognition, are constructive/destructive.

Section 2 reasons that emotions are an evolved biological system designed to give feedback on cognitive activities through the perception of physiological and biochemical behavior.

Sections 3, 4, 5 and 6 integrate this cognitive/emotional feedback circuit into proposed psychological and pharmaceutical therapies. Section 7 presents a method to progress towards emotional wisdom, which can guide cognitive activities towards healthy, successful, and environmentally adaptive deductions, conclusions and decisions. Examples of therapeutic exercises to develop healthy cognitive-emotional behaviors are outlined in Section 8.

Section 9, Emotional Guidance – The Dark Side, is a discussion of how nature’s wonderful mind, body, emotions and consciousness correlative relationships can go astray.

Section 10 summarizes how the human spirit is intertwined within a massive collection of neural networks and circuits. At the end is a collection of Appendices: Essays on Emotional Wisdom reflecting the impact of Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness upon the human landscape.

1.1 Introduction to Symbiotic Psychology

The physical pain of a hand on a hot stove brings about a very natural reflexive response. Such pain is a signal to get the hand off the stove. If the pain is ignored and the hand remains on the hot stove, the biochemical signature of the hand changes to the degree that the hand burns. If the hand is quickly taken off, maybe no medical attention is needed. If the
natural response of the body is usurped in some fashion and the hand burns a little, maybe a little salve would allow the healing. But the longer the natural signals are covered up or ignored, the worse the damage and the more extensive the healing process, including skin grafts or worse. The crux of the problem is disregard for the body’s signal to take the hand off the stove.

But aren’t emotions also giving signals? Certain cognitive perceptions, thoughts and actions feel good. Other cognitive perceptions, thoughts and actions feel bad. This feels good; this feels bad. What is the significance of understanding emotions as an evolved biological guidance system for cognitive behavior? What is the neurological liaison between mind, body, emotions and consciousness that promotes health and well-being? How can this relationship be exploited to develop more effective psychological and pharmaceutical therapies? How can this relationship be used in daily, moment to moment decisions towards happiness and well-being? (ref. background reading)

1.2 Cognition, Emotions, Physiology and Neurology

There is a vast array of interconnecting neural networks which allow communication between the different functional areas of the brain. These evolved neural circuits support liaisons between cognitive neural networks, the body’s biochemical physiology, emotional neural networks, and consciousness (Dubuc, *The Brain*). Whereas the five sensory neural networks provide information about the external environment, the emotional neural networks provide information about the state of the body’s environment itself.

There is an array of neural networks associated with positive emotions, a second associated with negative emotions and a third that inhibits or stops and freezes action (Dubuc, *The Brain*), (Goleman, Davidson 2017). Because different combinations of arrays are activated under different circumstances and nuances, there exist a great variety of correlative possibilities between cognition, the brain/body physiology and biochemistry, the emotional perception of feeling good and feeling bad, and the associated activities within each function.
Neural networks develop, grow, and even reorganize throughout life. New relationships among these networks develop as new lessons in life are experienced and learned. This attribute of neural networks is called neuroplasticity (Rugnetta, *Neuroplasticity*). As a result of neuroplasticity, every person has the neurological capacity to change and develop new interpretations of and responses to his or her environmental stimuli.

Cognition deals with the processes of knowing and awareness, namely, perception, recognition, conceiving – which includes imagination and inspiration – and reasoning (Encyclopedia Britannica, *Cognition: thought process*). The focus of this book however, is how emotions have evolved their own purpose and how knowledge of that purpose should be processed for the health and well-being of the individual. Emotional neural circuits provide feedback about how cognitive processes need to be further utilized before any internal mental deliberations can be properly concluded and any decisions made. The significance of negative emotions means the presence of a biochemical physiology that is unhealthy for the individual and the need for more cognitive deliberation. This internal work isn’t finished until positive emotions come to dominate and signify and reflect that a healthy biochemical physiology has been achieved.

### 1.3 The Five Postulates of Symbiotic Psychology

The following four postulates form a basis of Symbiotic Psychology. The implications of these postulates are developed in the remainder of the book.

1. **Emotions are the Perception of Biochemical physiology:** Cognitive neural circuitry activities (a) stimulate biochemical activity within the brain and body (b) that we perceive as emotions (c). The emotions that we feel (c) are the result of physiological biochemical activities (b), not their cause. The illusion of emotions is that emotions drive the mind and its biochemistry. Rather, cognition precipitates changes in the body’s biochemical physiology which consciousness then perceives as emotions. Therefore, since biochemical physiology is a consequence of cognitive behavior,
emotions are not constructive or destructive in themselves because they only exist as a reflection of very real constructive or destructive cognitive behaviors.

2. **Emotions Have an Evolved Correlations with Cognition:** The cognitive construct of emotions evolved out of the necessary correlative relationships between cognition, biochemical physiology, emotions and consciousness that promoted life throughout the ages. Emotionally feeling good must correlate with (a) the body’s biochemical physiology of health and well-being, (b) the mind’s knowing of health and well-being, and (c) an actuality of physical health and well-being. Therefore, cognitive activities should not dwell within emotionally negative events but, rather, should continue an iteration of various cognitive activities until emotionally good feelings reflect physical health and well-being and a focus upon that which is wanted and desired.

3. **Biologically, “What Feels Good is Good”:** Whether one is perceiving emotions, feelings, or affect, it will boil down to some aspect of feeling good or feeling bad. And, within the consequences of evolution, feeling good is healthy and right, and, feeling bad is not. Because this basic emotional system of feels good is good evolved out of the reptilian brain of might is right, parenting and community education and training must strive to push moral and ethical debate up into our mammalian brain where a more complex cognitive and emotional awareness of might for right, feels good is good, ethics can be sustained.

4. **Individuals Have an Amazing Capacity to Change and Adapt:** As a result of neuroplasticity, every person has the neurological capacity to change and develop new interpretations of and responses to his or her environmental stimuli. Neural networks develop, grow, and even reorganize throughout life. New relationships among these networks develop as new lessons in life are experienced and learned. Reality changes as new neural cognitive networks form. That which is understood and known to be real today may not exist tomorrow.
5. **Intention Gives Definition to Emotional Guidance:** Emotions without a defining intention is akin to sailing the open seas without a guiding star. With a destination, a vessel can be aptly guided through the waves and the sails can be properly trimmed to shape the wind. Whether a person intends a walk around the block after work or intends to summit Mount Everest in five years, intent sets into motion a series of harmonizing events. Emotions are calibrated and aligned to those intentions and are now able to guides cognitive and behavior activities towards fulfillment of these intentions. Cognitive and behavior activities that feel good or bad are emotional indications to consciousness of moving towards or away from one’s intentions.

Mental health and well-being of a society is determined by the mental health and well-being of its individual inhabitants. A culture that is ignorant of emotions’ role in guiding cognitive and physical behavior is subject to all kinds of forces that can mis-direct cognitive activities towards nefarious ends. Continual distortions of emotions’ evolved nature by current psychological, psychiatric, and pharmaceutical institutions only further sabotage emotions’ guiding influence towards mental health and well-being of a society and its inhabitants.

Until emotions’ true nature is understood, individual emotional behavior will be continually preyed upon by people who wish to control and subjugate individuals towards their own intentions, good or bad. Until emotions’ true nature is understood, life’s hardships can easily be assimilated into a tragedy of ill begotten intent to control and dominate others to conform to one’s own ignorant selfish needs, desires, and behaviors. Unless emotions’ true nature is understood, those who do not conform to one’s own ignorance may be deemed of a lesser God and subject to destruction.

The pain and hardships of life events plant seeds of intent. Whether these seeds nurture or destroy can be influenced by a formal education of emotions’ evolved role within human behavior. Society’s institutions – be they parenting, education, religious, political, or some other organization – all have a responsibility to empower individual intent for the health and well-being of the individual as a member of a culture and society among many on this planet.
Earth where humans are but one species of many. Humanity’s future resides within the
empowerment and understanding of individual intent and its relationship to emotional
guidance.

1.4 Author’s Note:
Within the United States – every year – 44,000 people kill themselves (https://afsp.org/about-suicide/suicide-statistics/). How many of those people made a decision, consciously or
unconsciously, to reject help from modern psychological and pharmaceutical therapy? What
about the mass shootings with the killing of innocent men, women, and children? Why
aren’t these mentally ill perpetrators reaching for help? Also, as a result of neuroplasticity,
every person has the neurological capacity to change and develop new interpretations of and
responses to his or her environmental stimuli. The irreverence of this biological wonder is
demonstrated within the U.S.A.’s criminal “justice” system. What is going wrong with
mental wellness in the U.S.? Can the mental health community do better? What are modern
psychological and pharmaceutical therapies missing?

Somewhere, sometime, somehow, academia must find some common ground. Since I began
voicing my concerns over psychological and pharmaceutical therapeutic methodologies
erroneously based within causal aberrant and destructive emotions, over a million
(MILLION) Americans have committed suicide, millions of other people have been put in
incarcerating conditions that only amplify their psychological injuries, and mass shootings
continue with no review of the psychological environments that are oblivious to emotions’
evolutionary design and that are fostering all of these atrocities. Lack of true academic
questioning and review of psychological and pharmaceutical emotional theory is a true crime
against humanity.

The thesis of this book is that emotions are perceptions of physiological biochemical states
and that these physiological biochemical states of the body are a product of cognitive neural
networks stimulating areas of the brain that in turn produce the changes in biochemistry.
Since emotions are a perception of a state of physical being precipitated by cognition, so-
called aberrant and destructive emotions are but a reflection of the true prime mover, cognition; and cognitive activities can be extremely aberrant and destructive. It is cognition that must be managed by understanding the significance and meanings of emotional perceptions.

I believe there is enough logical argument within this book to foster much-needed academic discussions. Until the time that such discussions occur, much can be individually accomplished by just understanding the arguments within this discussion and applying the principles of symbiotic psychology to everyday, mundane events in life. This book is my effort to promote a new wave of understandings within the symbiotic relationships between cognition, biochemical physiology, emotions, and consciousness.

2.0 Emotions as an Evolved Biological System

What if emotions are more than a stimulus for song, poetry and drama where poets bend and sway their audiences’ emotions up and down, as a roller coaster excites and thrills for the pleasure, or dismay of its breathless riders? What if emotions are an evolved biological system – like the muscular, skeletal, or nervous systems – and are functionally closely related to the sensory systems?

Is it possible to think of emotions as being separate from the evolutionary process of the human species? If emotions have been run through the evolutionary mill, i.e., not separate from the evolutionary process, what would some characteristics of the resultant design be? Is it possible to use the ideas and concepts found within evolution to form logical deductions and conclusions about emotions and feelings as they pertain to biological functions?

The notion that species develop by naturally selecting attributes that are advantageous for survival is the cornerstone of the theory of evolution. If any human is to live or even thrive to maturity where offspring will continue the survival of the species, might there be an evolved link or correlation between emotions and an individual’s cognitive activities and the body’s physiology? The following is a discussion to put forward the types of correlations that must exist.

2.1 The Mind/Body/Emotion Correlation: Evolution’s Impact

The following scenarios are indicative of evolution’s impact on the development of an emotional guidance system:

(1) If feeling good correlates with a well-balanced and physiologically vital body then feeling good while climbing a tree to gather food or while balancing on slippery rocks in a rushing stream to fish may not be hazardous. But if feeling good were to correlate with a weakened and lethargic physiology/biochemistry, such challenging...
actions would tend to be deadly. Such a false/positive correlation between emotions and physiological biochemical vitality would be disadvantageous to survival.

(2) How would a genetic line survive if feeling good correlated with (1) a cognitive knowing of strength, vigor, and adeptness with (2) an actuality of weakness and ineptitude? Such a correlation has a limited survivability when climbing trees or foraging across the savannas in search for food or, in a modern example, when in an inebriated state, a person confidently gets behind the wheel of a car to navigate through rush hour traffic. And where is the motivation to act when there is an actuality of vitality, vigor and strength but emotionally there is a feeling of illness, lethargy and weakness? It is logical to conclude that, evolutionarily speaking, feeling good correlates with vitality, vigor, and strength and feeling bad correlates with illness, lethargy, and weakness.

(3) Imagine that such basic life behaviors as breathing or eating were so emotionally painful – or the lack thereof were so pleasurable – as to bring about suffocation, starvation and death. Such an emotional/physiological correlation would lead to the demise of an individual and his or her genetic line. Whether this were a genetically predisposed or an inherited condition, or whether there even existed a genetically developed predisposition to learn such a behavior, such a false/positive correlation between emotions and physiology would hinder personal and genetic survival. Therefore, there is a natural correlation between feeling good with healthy physiological behavior and the way the body functions.

From an evolutionary perspective, feeling good means there is a positive correlation between the neural networks that activate (1) a cognitive awareness of strength, vigor, and well-being, (2) an actualization of a physiology of strength, vigor and well-being, and (3) the neural networks associated the emotions of pleasure. Biochemistry, both at the molecular level and the neural network level, must sustain the correlations between (1) the cognitive knowing of,
2.0 Emotions as an Evolved Biological System

(2) the actualization of, and (3) the feeling of strength, vigor and well-being. Simply put, if these correlations did not exist in this way a person would have a low probability of survival.

2.2 Cognitive Imagination and Evolution

How would a genetic line survive (1) if the body’s need for water did not stimulate the mind’s imagery of obtaining water or (2) if this imagery of obtaining water correlated with negative emotions? If the body needs water, this need must correlate with the mental act of imagining water and correlate with positive emotions associated with finding and drinking water. That is, there is a correlation between imagining the necessities of life and positive emotions. If, instead, there was a correlation such that the imagery of food, water, and shelter brought about negative emotions, then these basics of life would be avoided, leading to an evolutionary dead end. So, for the survival of the species, there must be an evolved correlation between (a) the evolved neural networks of the cognitive brain of imagination and (b) the neural networks of the emotional system such that it (c) feels good when (d) the individual’s imagination dwells upon the presence of the food, water, and shelter, which (e) is wanted and desired by the body in order to survive.

A person dwelling upon the presence of that which is wanted triggers a healthy physiological/biochemical condition within the body which activates an emotionally positive neural network. A person dwelling upon the lack of that which is wanted triggers an unhealthy physiological/biochemical condition within the body which activates an emotionally negative neural network.

How would a genetic line survive if the idea of not obtaining food, water, and shelter correlated with feeling good? Or, how would a person (and his or her genetic lineage) survive if cognitive imagery dwelt upon that which is not wanted, and this mental activity did not correlate with negative emotions? A person dwelling upon that which is not wanted triggers an unhealthy physiological biochemical condition within the body which activates an emotionally negative neural network perceived by consciousness. There must have been an
evolutionary development that resulted in these correlations or we wouldn’t have survived as a species.

To succeed, and even thrive, in life comes from bringing a “healthy attitude” to life and its daily, moment to moment decisions, especially with those cognitive choices that are made about what to think, imagine and dwell upon. “Healthy attitude” means having the desire and intention to choose cognitive activities (ideas, thoughts, beliefs, concepts, awarenesses, deductions, reasons, dreams, and imaginations) that feel good. People who are successful and enjoy life are such because they have made a decision to use emotionally negative cognitive activities as motivation to find, allow, develop, and dwell upon those emotionally cognitive activities that feel better. Physical health and well-being are dependent upon cognitively working towards better and better feeling thoughts until cognitive activities that feel good dominate one’s internal conversation. Mental health and well-being depend upon having the motivation, intention, and ability to cognitively work at emotionally feeling good. But problems occur when a “what feels good is good” attitude doesn’t reflect a self that lives with strength, vigor, adeptness and a compassion for others to realize the same.

2.3 Conclusion

When factoring in evolution, the emotional perception of physiological and biochemical states of the body become an integral part of the brain’s neural network for maintaining the body’s health, strength and vigor. Emotions bring another attribute of awareness to a person’s consciousness as to the nature of his or her cognitive and physical activities. For simplicity, emotions can be divided into two areas of awareness: those emotions that feel good and those emotions that feel bad. Because of these evolved mind/body/emotion/consciousness correlations, feeling good or feeling bad has a significant meaning as to the biological health of an individual. Cognitively activating the physiological neural networks pertaining to strength, vigor, adeptness, and well-being activates an emotional positive neural network. The perception of negative emotions is a warning signal
that the continuation of such cognitive and physical activities is having a negative impact on the physical health and genetic survival of the individual.

The simple arguments above are constructed to illustrate how evolution brings about specific relationships between the mind, body, and emotions and consciousness. Many more complex scenarios can be developed for the variety of relationships people have with their physical and social environment. Also, the element of time and the relativity of strength and vigor are not discussed but easily can be factored in for added layers of complexity. The moral and ethical debate of a ‘feels good is good’ behavior guide has been going on for thousands of years and will continue for thousands more, but ultimately it is an individual debate that continues throughout a person’s lifetime of experiences and, hopefully, a lifetime of continual growth and greater understanding.
3.0 Depression: Mental Illness or Mental Injury

The physical pain of a hand on a hot stove brings about a very natural reflexive response. The pain is a signal to get the hand off the stove. If the pain is ignored and the hand remains on the hot stove, the biochemical signature of the hand changes to the degree that the hand burns. The feeling of pain is significant to the health and survival of the body. The issue is the lack of responsiveness to the pain. But is the condition of the hand an illness or an injury?

From the perspective of an emotional guidance system, the biology of a biochemical “abnormality” associated with emotional pain (such as depression) is analogous to the biochemical “abnormality” associated with the hand’s physical pain on a hot stove. The more the emotional pain is (1) ignored, (2) suppressed or usurped, (3) biochemically blocked or sedated, (4) blocked by neurological damage, or (5) unacknowledged for any other reason such that the individual’s thoughts and the activities of his or her mind remain on the ‘hot stove,’ the more the associated biochemical signature and neurological processes will differ from that of a ‘normal’ healthy person (Raison, Jain, Maletic, 2011). The issue is the lack of responsiveness to the emotional pain, which calls out to get the mind off a potentially damaging mental stream of consciousness. But is this biochemical abnormality an illness or an injury?

The illness in mental illness arises when healthy responses to the emotional system are absent and the individual does not have the mental/emotional capacity, agility, or wisdom to respond to their emotional guidance in a natural and healthy manner to get their mind off of the hot stove. But is this lack of emotional responsiveness an illness or an injury?

3.1 Cure an Illness, Rehabilitate an Injury

The observation that people with mental illness have a biochemical abnormality compared to from the mentally healthy people is well documented (Maletic, Raison 2017). But there is, by evolutionary design, supposed to be a biochemical anomaly when a person’s mental
activities are unhealthy, that is, when cognitive activity dwells upon unwanted, emotionally negative aspects of life. When a person’s mind remains on the hot stove, they are activating a completely different neurological network. There should be a different biochemical signature. The fallacy is in the attempt to pharmaceutically normalize a patient’s biochemical physiology without also removing that person’s mind from the cognitive hot stove and rehabilitating healthy neural network activities between cognition, body, emotions and consciousness.

Where well-being and a natural emotional responsiveness exist, no medical attention is needed. But if the mind ‘burns’ a little, maybe some simple medication accompanied by supportive psychotherapy would promote healing and a return to a naturally functioning neural network of the healthy mind, body, and emotion correlative relationships that can be utilized by consciousness.

However, in acute cases where such a natural emotional response, awareness, or behavior is lacking, and where healing is not occurring, supportive medication and hospitalization may need to be more invasive. Extensive rehabilitation therapy will be needed to take advantage of the brain’s neuroplasticity to recreate a new neurology of healthy mental responsiveness to its emotional guidance system. Supportive pharmaceutical intervention should be an aid to the patient, as a crutch, to help him/her regain healthy responses to their emotional guidance system. The crux of the problem for those suffering to this degree began with their disregard, or ignorance of, a wondrous and highly evolved emotional awareness of healthy biological conditions.

3.2 Responding to a neurological emotional guidance network

There is great power within the activation of the emotional negative neural network and the realization and conception of that which is not wanted nor desired. But this power is only actuated if the opposite end – the positive, pleasurable end of the spectrum – can be known,
3.0 Depression: Mental Illness or Mental Injury

that is, perceived, recognized, conceived, and reasoned and then acted on (Encyclopedia Britannica, *Cognition: Thought process*).

People who are healthy, happy and successful in life use their power of consciousness to pivot off the emotionally negative aspect of a scenario and into a more emotionally positive, *re-framed* scenario. They have learned and developed the necessary skills that are essential in our society to manage their focus of attention in response to their own emotional feedback. They have developed a robust cognitive dexterity and ability where disruptive cognitive events only temporarily upset healthy biochemical balances. They have the motivation, drive and, most importantly, the proficiency to cognitively create a scenario of that which is wanted and desired – which initiates a balanced and a healthy biochemical physiology activating the correlative, emotionally-positive neural network.

The development of the extreme biochemical signature of mental illness that requires psychiatric drugs is the result of a chasm that developed between the cognitive activities within the brain and the individual’s responsiveness to the emotional guidance system.

Severe mental injury or illness that may never fully heal may have resulted from neurological damage, disease, drug abuse, prolonged and extensive use of medications, trauma, birth defect, or some other inherited condition. On the other hand, more treatable conditions may have developed through life from a person’s inability to process the indoctrinating effects of life’s significant characters. Parents, religious figures, teachers, peer groups, or the constant barrage of information in this new age of technical wizardry can lead to a breakdown between cognition and consciousness’s responsiveness to its own evolved emotional guidance system. Less dramatically, such a breakdown may be caused by the many interactions life presents while growing up – where others’ emotional guidance systems have usurped, instead of enhanced, a person’s natural emotional responsiveness.

### 3.3 Conclusion

Whatever the dysfunction is called – illness, disease, disorder – and however the symbiotic ties between cognition, physiology, emotions, and conscious were disrupted, the objective in psychological and pharmaceutical therapy should be to reestablish the evolved and symbiotic

*Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness (rev2020-01-23a)*
relationship between these constructs where a person can enjoy and thrive in life with its many exciting challenges. The neuroplastic capacity of the brain to establish new neural circuits takes time. The psychological and pharmaceutical rehabilitation methods to reinforce this new neurological growth with emotions as a perception of biochemical physiology have yet to be properly identified and researched.

References:

4.0 Cognitive-Emotional Rehabilitation

There is a need to develop an understanding of emotional guidance and cognitive regulation in the discipline of psychological and pharmaceutical therapy. Emotional regulation is a misconception and a false construct of actual bio-physiological events. To pharmaceutically regulate emotions is to obscure cognitive behavior from the very consciousness that needs to comprehend its own behavior. Emotions are a perception of physiological biochemical conditions within the body precipitated by cognitive behavior. It is cognitive behavior that must be accessed by the individual with the help of the emotional system. A psychologist can aide this understanding and can teach the individual how to use emotional guidance to change correlative cognitive activities. Any undesirable cognitive activities can be used as a launching pad to reach for less negative and, eventually, positive and productive cognitive activities that result in a healthy biology and associated positive emotions.

Cognitive rehabilitation must help individuals to use the neuroplastic capacities of the brain to develop new and emotionally positive cognitive habits of thought, perception, and imagination. Such a discipline would help a person develop internal powers of choice and creativity to move the mind towards activities that result in associated harmonious emotional responses. Besides the cognitive activities of recognition, conception, reason and imagination, there are the perceptual activities of the senses – touching, seeing, hearing, smelling, and tasting – as well as the physical activities a person may engage in. All cognitive activities associated with these activities also give rise to associated emotional responses to be heralded and empowered into well-being through encouragement by the psychologist.

There is a need for a psychotherapy that fortifies a patient’s desire to stay on the road toward a natural state of health and well-being: a discipline where a patient’s own emotional guidance system is acknowledged, validated and reinforced. This implies empowering a patient with the ability to reach for and chose cognitive activities that feel better, so they actually do feel better in the present, rather than reaching for some goal to be realized in the
future. These cognitive activities may simply change emotional experiences from painful to less painful, but eventually they will result in a change from feeling good to feeling even better. The successful caregiver will develop a patient’s cognitive ability to find cognitive activities that feel better now, in the present, in this therapeutic session. The goal is for a patient to feel even better by becoming mentally and physically well through leading a life responsive to their own emotional guidance system. “Wellness” ultimately means to have a life without therapy and without medications. A person may never reach a state of mental health that is without therapy or medications, but just demonstrating with them that they have the ability and the power to feel better now creates hope. Hope can make all the difference between staying with or leaving a program. It can make the difference between staying with or leaving life itself.

4.1 Emotional Guidance
Within the psychology of “emotional guidance,” the naturally evolved response to negative emotions is for a person’s consciousness to use the energy from the correlative negative cognitive/emotional state to pivot the mind’s activities onto activities that bring positive emotions. If emotions are skewing negative, it is the person’s signal to stop and take steps towards a new perspective and to refocus the mind and its activities onto a reframed view of the subject. If these efforts fail, then learning to refocus consciousness onto something entirely different may be the best action to bring a more positive emotional response. As people grow from childhood to adolescence to adulthood, they learn more complicated and sophisticated facets of (1) recognizing and acknowledging the presence of negative emotions, (2) stopping the spiral down the emotional staircase earlier and earlier in the decline, or as in the case of mania, stopping the upward spiral, (3) reframing and refocusing the consciousness into a less negative emotional perspective, and (4) repeating this reframing and refocusing into better feeling emotions until they are back at an emotionally positive, healthy and harmonious vantage point.

Maintaining a healthy and joyful lifestyle requires having an ability to move up or down the spiral staircase with ease and fluidity, just as emotions flow up and down with the changing
consciousness of watching a movie or reading a book. Issues involved within mental illness, 
addictions, and violence develop when this more complicated and creative aspect of a 
healthy cognition are absent, usurped, driven, or even manipulated out of a person’s 
repertoire of survival skills. The resulting loss of choice to get on or off the emotional roller 
coaster can leave an individual broken and in need of professional help.

4.2 Defining Mental Health and Well-being

Well-being and the success of any professional therapy, mental or physical, is not 
defined with the absence of illness but by the presence of health, vigor, and joy along 
with the necessary cognitive skills, abilities, and motivation to nurture these 
conditions with one’s own emotional guidance.

Mental, physical, and emotional wellness depend on actuating evolved correlative 
relationships. Emotions are a perception of physiological biochemical conditions which are 
an actualization of cognitive activities. If a person’s emotions are working as evolution 
developed and are giving an accurate perceptual feedback on their biochemical physiology, 
then a psychological problem is not an “emotional disorder” it is a “cognitive disorder.” A 
true emotional disorder would be akin to a sight disorder such as near sightedness, far 
sightedness, or even color blindness. A distinction must be made between a properly 
working emotional system – one which gives accurate feedback on the body – and an 
emotional system with a disorder – one which has a non-associative relationship with the 
body and mind.

Within the context of emotional guidance, a person is mentally healthy when they can 
naturally (i.e., without alcohol, drugs or medications), respond to their own emotional 
guidance and move up or down the emotional spiral staircase by choice. A mentally healthy 
person has the aptitude, skills and capacity to return to the pleasures and harmonies of life 
from event to event throughout life. Having mental and physical health is being capable to 
do the work that is necessary to move within the emotional spiral staircase: from a
4.0 Cognitive-Emotional Rehabilitation

mental/physical/emotional negative state into a mental/physical/emotional positive state of existence.

Well-being and the success of any professional therapy, mental or physical, is not defined by the absence of illness but by the presence of heath, vigor, and joy and the necessary cognitive skills, abilities, and motivation to nurture these conditions with one’s own emotional guidance.

Once a patient learns to maintain their own physical and mental well-being by acting from a positive emotional state, then a new learning process begins: one which delves into the ethics of these actions and thus develops a comprehension of “right” action. We live in an environment where sales and marketing have become very sophisticated and cunning in the manufacturing of feeling good states of being. In this environment of caveat emptor (let the buyer beware) and ‘free speech’, not understanding the pitfalls of ‘feels good is good’ can be very costly to the individual and in the long run to the health and well-being of the family, community, and society.

Additionally, society needs to rethink the meaning of “criminal justice” and reform ‘punishment for crime’ into a justice system that actually promotes healthy cognitive rehabilitation and healthy neuroplastic development and a return to well-being. Well-being means health, vigor, energy and vitality with a joyous anticipation for the future and all its uncertainty.

5.0 Psychological Therapy

“Doctor, what is your end game? Up to now I have been passively going to therapists like a bump on a log and now I am sitting here in front of you. I want to get well! I believe I can get well! I want to know how listening to you will get me on a path to well-being. I want to feel good and be free of all you doctors. I know a person who was psychotic…. he heard voices, had delusions and fantasies. He really tripped out at times and would ‘wake up’ in a hospital. He tried to kill himself. He spent over 15 years heavily medicated and still his psychotic manic episodes ended him up in mental hospitals. He spent years talking to therapists like you and doped up on meds, but now he is free…. free from doctors, meds, hospitals, padded cells and he no longer goes ‘schizo’. I want to be free. How is your therapy going to get me there? How will I know if I am getting well? What am I doing wrong? How are you going to help me change so I don’t ever have to see the likes of you again?! Sorry, but that is how I feel.”

Evolution has established a cognitive/physical/emotional correlation such that emotions provide consciousness with an awareness of the health and well-being of the body’s physiology and biochemistry. A useful definition of mental illness is the inability of a person to respond constructively to emotional signals. Individuals feel or perceive emotions and normally respond to their emotional guidance system by creating and accentuating cognitive activities that bring about positive feeling emotions. Negative emotions are a driving impetus to create new and different cognitive activities that bring about a healthy, good-feeling emotional response. If feelings are skewing negative, this is the brain’s signal to cognitively reconstruct this negative stimulus or to get off this subject entirely and refocus the mind and its activities onto something that brings a positive emotional response. The objective is to keep the mind and its cognitive powers of perception, recognition, conception, reasoning, and imagination – along with the body’s capacity of actualization – continually reaching for better cognitive activities and thus, for the good feeling emotional responses indicative of a healthy biochemical physiology.
Within the concept of emotional guidance is the cognitive construct of want and desire: more precisely, the pleasure one feels when perceiving and cogitating upon obtaining and having that which is wanted and desired. The foundation of a psychotherapy rehabilitation that asks, “What do you want?” reaches through to activate the core of our evolved DNA that creates pain when hungry and pleasure with fulfillment. The beginning of healing starts with reaffirming and strengthening the cognitive neural networks of an individual’s objects of desire and wanting, and, their correlative emotional feelings of pleasure.

“What do you want?” is a question that brings about an emotionally negative response if the patient is dwelling within the cognitive constructs of the ‘not wanted’ or ‘lack of’ that which is actually desired. Our evolutionary reflexes are to move consciousness into cognitive activities of ‘that which is wanted’ and to how to attain it. The therapist’s role is to aid in their patient’s understanding of this process and to train and develop their cognitive skills necessary to pivot cognitive activity from that which is ‘not wanted’ to cognitive activity of that which is ‘wanted’…. from feeling bad to feeling good. Emotions are the guiding light regarding the success or lack of success in this change of focus within cognition. Neuroplasticity of the brain means that everybody has the capacity to realize a new and more beneficial reality because the brain can rewire itself and create new circuits of understanding and alternative healthy behavior.

Therapy based on the symbiosis between cognition and emotions reaffirms an evolved biological guidance system where emotions are used to evaluate cognitive behaviors. In stark contrast to ‘emotional regulation’, with this approach emotions are not ‘regulated’ but are used instead to regulate, that is, to guide cognitive behaviors. Also, in this context, emotions are not viewed as ‘out of control’ nor is there a concept of ‘emotional disorder.’ On the contrary, it is the cognitive mind that is ‘out of control’ and the therapeutic process addresses instead, a ‘cognitive disorder.’ Deviant emotional perceptions are reflections of this aberrant cognitive behavior. The emotions are not treated as dysfunctional but, rather, are understood as very functional, in that they are bringing to consciousness the
5.0 Psychological Therapy

dysfunctional aspect within the mind’s cognitive activities that is creating the aberrant
biochemical physiology we are perceiving as emotions. It is these irregularities in cognitive
behavior that need to be addressed. Emotions are but the messenger.

It is the symbiotic nature of cognition and consciousness that enables a person to ferret out
that which is wanted from within that which is not wanted. This nature also enables a person
to acknowledge that which is not wanted (or focus on the lack of what is wanted) from
within that which is wanted. Cognition and consciousness have a basic biological function to
maintain a healthy and vital biochemical physiology. Emotions have a function. Emotions
bring an awareness to consciousness of the health, or lack thereof, of cognitive activities.
Feeling good correlates with a healthy biochemistry and feeling bad correlates with an
unhealthy biochemistry. Psychological and pharmaceutical therapy must honor these
functions. Mental ‘illnesses’ arise when healthy responses to the emotional system are absent
and the individual does not have the mental/emotional capacity, agility, or wisdom to
respond to their emotional guidance in a natural and healthy manner to ‘get their mind off the
hot stove’.

The goal and practice of psychological rehabilitation is to utilize the brain’s power of
neuroplasticity and to develop within a person the mental agility and reflexes to
constructively respond to his or her emotional guidance system. At first, these steps may
simply go from painful emotions to less painful emotions, but eventually, with the
development of new habits and skills of mental agility, the steps will be from feeling
emotionally good to feeling emotionally even better. The presence of these skills is the
presence of mental health and well-being and the ability to lead a ‘normal’ life.
6.0 Pharmaceutical Therapy

“Doctor, are you working with my therapist? Her therapy is helping me get control of my thinking. If a thought doesn’t feel good, I’ve got to find another that feels better. But how can I do that when these meds you keep giving me make me feel all doped up. She says I need to understand that my emotions have evolved to help me get my mind off what feels bad. Doctor, your drugs make me feel awful. How can I use my emotions to understand what’s going on in my head if your meds are screwing me up? Also, do you have an end game of getting me off these meds? If I do get more control of my mind, can’t we change these meds to something less doping? And, if I get better, then do you have another drug after that that is easier on me? What am I getting at, Doctor, are steps to getting well, steps to get off my meds and not end up back in the psycho ward again. You know, I am getting to like the Grim Reaper more and more as these years with you pass by. He has an end game. But my psychologist is helping me to get normal. Do you really have an idea of how to help me so that I can get normal? How are you coordinating my pharmaceutical therapy with my psychological therapy so that you guys are working together and helping me to not see you ever again?”

Medications can be very effective in “normalizing” external behavior from an observer’s perspective, but what are these chemicals doing to the cognitive-biochemical-emotional neural feedback circuit? What are they doing to consciousness’ ability to control and change cognitive activities in response to emotional guidance? How can emotions guide cognitive behavior when emotional or physiological neural networks are being targeted with artificially introduced chemical agents?

Emotions have an evolved role in guiding cognitive behavior and decision-making. If emotions are perceiving biochemical physiology, and cognition actualizes biochemical physiology, how are emotions ‘out of control’ and in need of ‘emotional regulation’? No! It is cognition that is ‘out of control’ and therefore, it is cognition that needs regulation.
Any pharmaceuticals designed to impact the emotional system also impact the emotions’ correlations with (1) the mind’s cognitive activities and (2) the body’s physiological biochemical activities and (3) the emotions’ response to the body’s physiological and biochemical conditions. Biochemical agents must harmonize with emotional neurological construction and augment the brain’s neuroplastic capacity for developing new constructive habits. The purpose of pharmaceutical therapy should be to assist consciousness’ power and ability to manipulate cognition and thus to help consciousness to respond to emotional guidance in a healthy and constructive manner. That is not the intent of current pharmaceutical therapy.

6.1 Psychiatric Medications Designed for Healing

Any attempt to understand and affect the internal human environment must be taken with an understanding of the changing biochemical conditions of that environment as indicated by an evolved emotional neurocircuitry of the human body.

There is a need for psychiatric treatment to use drugs and medications that help consciousness to regain its own power and responsiveness to its own emotional guidance system. These medications should also help consciousness break away from a narrow and myopic world view which can spiral cognition out of control. There is a need for pharmaceuticals that can help create a biochemical environment where the personal powers of an individual’s consciousness can start making attempts to be more responsive to his or her emotional guidance system. These new agents must also augment the brain’s neuroplastic capacity.

These new types of pharmaceuticals would aid individuals in their abilities to use their own cognitive skills and reflexes to co-function with their emotional guidance systems. These new medications would aide and empower consciousness either to take the mind off the negative downward cognitive spiral of depression or to take the mind off the out-of-control upward cognitive spiral of mania. As a patient’s new skills are developed and new neural circuits are cultivated, the need for and the types of pharmaceutical assistance change. There

Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness
(rev2020-01-23a)
6.0 Pharmaceutical Therapy

always should be the goal to eventually remove pharmaceutical assistance entirely. But, like
the hand on the hot stove, the neurocircuitry within the brain can be “damaged” so
extensively that no amount of training and development will ever succeed because entire
functions of the brain may have been irreversibly programmed into destructive patterns. In
such cases, there is the possibility that the mind/body/emotion chasm may be permanent,
resulting in a need for permanent pharmaceutical intervention and, in some cases,
hospitalization. Nevertheless, new pharmaceutical research is required to address a new
paradigm in which cognition drives the biochemical physiology that emotions perceive.

6.2 Masking Neurological Processes

There is a danger of medications masking destructive cognitive behaviors that normally are
exposed through erratic, abnormal, and convoluted emotional feedback. If these emotional
reflections of aberrant mental and physical behaviors are ignored or camouflaged with
pharmaceuticals and if irregular cognitive behavior is left unaddressed without proper
psychological counseling and therapy, cognition may fester unabated and create a myopic
vortex of circular mental and physical behaviors. This psychosis can break out with
disastrous consequences to the patient and to others, who may become characters in a
manically conceived tragedy played out in real life.

The approach proposed in this book does not negate the importance of pharmaceutical
therapy, rather, it redefines its purpose, which is to target the brain’s neuroplastic
environment and to help individuals redevelop a healthy cognitive activity in response to
their perceptions of emotional feedback about their physiological biochemical states of
being. As discussed earlier, a person has an evolved emotional guidance system that
promotes cognitive behavior that feels good emotionally. Negative emotions promote
avoidance behaviors. Mental illness may be defined as a consciousness’ inability to
constructively respond to their own internal dialog between cognition and emotional
perceptions and the inability of consciousness to actively engage in emotionally positive
activities that are useful, healthful and life-giving. Pharmaceutical therapy should augment
psychological therapy to create conditions for redeveloping the neural networks that
reinforce evolutionary design.

6.3 New Opportunities in Medicine
The argument presented here for understanding emotions as a product of the evolutionary
process opens up vast new opportunities and possibilities within the fields of psychology and
pharmacology to rehabilitate the cognitive attributes of mental illness while recognizing and
honoring the evolutionary role of emotions. There is certainly a need to identify new
medications that are appropriate for healing. Pharmaceuticals need to work with and augment
the cognitive rehabilitation processes within psychotherapy. And, most importantly, the
argument presented here opens the possibility of a new hope for patients. Patients may now
approach daily psychological and pharmaceutical therapies with the hope and anticipation of
new healing possibilities within their journey back into well-being and joy.

A successful return to well-being and joy takes work on the part of both caregivers and
patients. If pharmaceutical intervention is required to stabilize a patient’s cognitive behavior,
there is still a need to develop programs that reduce this pharmaceutical impact. As a
patient’s rehabilitation promotes the new skills and habits necessary for consciousness to
respond to emotional guidance in a healthy and productive manner, less invasive drug
therapy is required. Any healing and return to wellness are dependent on the desire,
determination and fortitude of patients to seek wellness and to develop healthy new habits
and patterns of cognitive behaviors in response to their emotional guidance. Likewise, the
desire, determination and fortitude of the therapist, the psychologist, the psychiatrist and the
pharmacist play their roles within the patient’s healing process of restructuring cognitive and
emotional neurology and a return to well-being.
7.0 Cognitive-Emotional Wisdom

The success of our teachers in life – whether they are our parents, teachers and other students in school, religious leaders, bosses at work, or the powerful academia, political, and business leaders who set the stage for our lives – is in their ability to empower us with the skills and abilities to think and to feel good, and to help us move our thought and debate up into the mammalian brain. Here, a “what feels good is good” mentality can evolve into broader and greater awareness of both short and long-term consequences, and decision-making and action can mature into greater complexity and imagination. With such education and personal development, “what feels good is good” can have a compassionate foundation for existence.

To have cognitive-emotional wisdom is to have the cognitive and emotional understanding and ability to avoid acting from the lower platforms of despair, depression, and anger. It is to have the cognitive tools and agility to move up the emotional staircase and to act from platforms of good feelings where clarity, health and vigor reside.

The steps to move up the emotional staircase (or emotional hierarchy) vary depending upon the set of emotions involved. One order of progression may be to move from despair, to anger, to frustration, to displeasure, to pleasure, to joy, to delight, to exhilaration, and finally, to ecstasy. Most people do not have the ability to go from despair to joy. That would be too great a leap. But they may go from despair to anger, from anger to frustration, from frustration to displeasure, from displeasure to pleasure, and from pleasure to joy over time.

Development of cognitive-emotional wisdom also helps an individual to develop the desire, courage, and tenacity to do the work necessary to move up the emotional staircase and to continually reach for thoughts that feel better. Poetry, music, dance, the arts, and sports can all be important motivators because successful participation within these disciplines demand action from higher levels of cognitive awareness and a more refined response to emotional perceptions. Every step higher in the level of accomplishment demands an even greater commitment to a cognitive discipline with emotional guidance. Every step higher is a
movement into greater happiness, joy and passion. Think about it. Physical and cognitive
agility, coordination and strength, all key attributes for an athlete’s success, require the
athlete, as a consequence of evolution, to be joyous and passionate within their endeavors.

As individuals mature into adulthood, they should continually be developing new and more
intricate methods of utilizing their emotional guidance to create new and more complex
harmonies within their minds and bodies and with their external world. The complexities of
the mammalian brain need to be utilized to adapt a prehistorically evolved emotional
guidance system to the demands, complexity, and nuances of our modern society. Having
cognitive-emotional wisdom also means having a broad enough perspective on “what feels
good is good” to understand that ‘what feels good’ in the immediate present may have a
completely different emotional response in the very near future. Jumping off a cliff may feel
great, but the landing leaves much to be desired.

The mind and body exist within a multitude of conditions and activities, all creating a
symphony of emotional feedback and harmonies. It is these harmonies and disharmonies
that individuals must bring together as they conduct the symphony of their lives’ creations.
The primary goal and objective for society and its members should be to nurture and guide
individuals into their own beings as creators of their own lives. Much too often, societal and
individual actions create schisms between individuals and their own personal emotional
guidance, sometimes innocently, sometimes with benevolent intent, but sometimes with
malicious intent to manipulate individuals for ulterior purposes, such as exploitation or
control.

7.1 Development of Cognitive-Emotional Wisdom

The narrowness of myopic mental vision and perspective plays a role in mental illness and
aberrant behaviors to strive for action that is not myopic but, rather, integrates the totality of
a person’s cognitive and emotional universe. Just as the various sections of an orchestra
must be aware that they are playing in the same key to remain in harmony, the various
7.0 Cognitive-Emotional Wisdom

aspects of a person’s consciousness and very being must find harmonious integration for the
to remain whole and mentally healthy. Otherwise the dissonance that can develop
within a person to accommodate society’s diverse demands can become so great that it may
be impossible for the person to remain whole and mentally healthy. To be mentally well,
individuals must have successfully mastered the necessary skills to navigate their cognitive
and emotional processes through life’s challenges and adventures. They must successfully
integrate the lessons demanded by society and develop the necessary cognitive-emotional
wisdom to succeed.

In a healthy, cognitive/emotional symbiotic system, emotionally negative activities of the
mind must be a source of inspiration and creativity: inspirations for new, emotionally
positive and transformative cognitive activities that are the necessary precursors to healthy
physical action. Emotional wisdom is reached when emotionally positive cognitive and
physical activities bring health and vitality and nurture a constructive, cooperative and
successful personal environment. Emotional ignorance, on the other hand, is when
emotionally negative cognitive activities run amok: externally they create destructive
physical actions and internally they create unhealthy environments susceptible to disease,
ilness and injury.

The first step towards cognitive-emotional wisdom is to establish a person’s awareness of the
fundamentals of the emotional feedback system. Unfortunately, even the syntax of language
misrepresents the mind, body, emotion relationship with consciousness. To say that a
person is “emotionally out of control” or having a “fit of rage”, or “acting out in anger” or
committing a “crime of passion” is an incorrect characterization. The person is not
“emotionally out of control” but, rather, they are “cognitively out of control” because it is the
cognitive activities that are creating physiological and biochemical changes, which
consciousness perceives and calls emotions. Emotions cannot be aberrant and destructive
because they are but the messenger. It is cognition that can be aberrant and destructive. It is
cognition that is creating the biochemical physiology that is running afoul.
The phrase ‘don’t be so emotional’ and the concept of ‘emotional disorder’ do not treat emotions as a perception of mental activities via biochemical physiology. This use of language obscures the notion that the display of a person being ‘emotional’ is the direct result of his or her current cognitive activities and it is these cognitive activities that need to be addressed.

Cognitive-emotional wisdom is born when emotionally depressed persons begin to understand and accept the relationship between their depression and the nature of their thoughts. The fall into depression is not their fault but healing demands taking new responsibilities. For depressed persons to continue dwelling upon the people and events responsible for their current condition is to create barriers to understanding and accepting their new responsibilities for their own thoughts and actions. Cognitive-emotional wisdom means to begin taking new responsibilities for one’s own behavior and to change and develop new habits of thought and perspectives. A neuroplastic brain makes all this possible.

(Ref. 7-1)

**7.2 Trauma and Addiction Corrupting the Cognitive-Emotional Relationship**

The recollection of trauma memories is a reenactment of events which differs from the malleable story telling nature memories of normal events. With trauma, almost any awareness can trigger a cascade of very real events within the cognitive mind that reenacts critical and specific parts of the original horror. The key to healing is to bring the traumatic reenactment out of the dark depths and hidden awareness into the story telling nature of memories where new cognitive activities of understanding can modify the horrors into a palatable memory. Traumatic events stamp and imprint a neurological loop within the brain that corrupts the natural cognitive-emotional relationship and continuously affects the body and decision making throughout life unless interceding therapeutic work disrupts the process.

(Kolk, B. 2015)

All traumatic events, can surreptitiously affect decision making and behavior to where behavior and decisions are not based within a freedom of being and desire but within the
confines and restraints of fearful avoidance. Traumatic events can covertly initiate behavior from unreasonable outbursts and aggression upon oneself and others to seemingly reasonable and rationale decision making to paralytic depression. Traumatic events disrupt a natural harmony of being to where an individual dissociates one’s self from emotion’s evolutionary function to promote health, prosperity, and well-being.

The correlative relationship between mind, body, emotions, and consciousness has evolved to promote individual health and well-being (ref Section 2: “Emotions as an Evolved Biological System”). Trauma may be defined as an experience – or series of experiences – so severe as to short circuit the normal harmonious and healthy flow of electro-biochemical activity within and between neural network areas within the brain and body that disrupts a person’s evolved reaction to seek and maintain cognitive activities that feel good. Human beings have evolved to be healthy and joyous. Culturally this may be far from the norm and be an indication of a broken culture and society rather than an indication of natural human character. A cultural lack of awareness and understanding of the natural cognitive-emotional relationship may promote dubious and insidious behavior that only continues the chain of pain, suffering, and trauma upon the next generation.

Self-prescribed remedial behaviors in response to traumatic events can easily become addictive rather than healing. Self-medication with alcohol, tobacco, and other “recreational drugs” may also – and very quickly and drastically – disrupt natural cognitive-emotional activity beyond its elastic capacity to return to normalcy. As a hand that was forced onto a hot stove may forever be scarred and may even become functionally impaired, trauma may severely impact internal biochemical physiology and adversely affect natural cognitive and emotional behavior as well as the physical expression of that behavior.

Behavior modifications, street drugs, and even properly prescribed medications used to cope with trauma are addictive for two reasons. One is that they buffer consciousness from the pain of the traumatic event and, two, especially with drugs, withdrawal symptoms can be so painful and severe as to prevent any cessation of use. If adaptive behaviors to cope with

*Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness* (rev2020-01-23a)
7.0 Cognitive-Emotional Wisdom

trauma are innocuous, any traumatic injury may never be acknowledged nor the need for any remedial action be recognized. Only when adaptive behaviors become disruptive – or even destructive and criminal – to self or others, does the need for cognitive-emotional rehabilitative therapy become a serious consideration.

The nature of what constitutes a traumatic event or addictive behavior is highly individualistic. Common to post traumatic and addictive behavior is a lack of a natural responsiveness to an evolved emotional system designed to guide cognitive behavior towards individual health and well-being. Any lack of joy and well-being within a supposedly healthy and constructive lifestyle is an indication for the need of cognitive-emotional education and/or rehabilitation intervention. Society has a moral obligation to provide the necessary education and training within its schools, hospitals, and prisons to establish individual awareness and responsiveness to healthy cognitive-emotional behavior. Section 8.2: “Cognitive-Emotional Rehabilitation and Strengthening Exercises” provides a descriptive list of possible rehabilitative behaviors. Although these exercises are all relatively safe, they may be abused without the basic understanding and knowledge of why and how they are designed to reestablish a natural and healthy relationship between mind, body, emotions, and consciousness. Dr. Bessel van der Kolk, M.D. has written a wonderful book on trauma, *The Body Keeps Score: Brain, Mind, and Body in the Healing of Trauma* (2014), New York, NY, Penguin Books. Part Five, Paths to Recovery provides a series of healing avenues that should be explored by anyone suffering from trauma as well as by anyone who may have an interest in societal and individual well-being.

Research studies are revealing new realizations and understandings of a neuroplastic brain designed to rewire itself (Doidge, 2015). The neuroplastic brain makes it possible to establish new, healthy, and constructive awareness and behavior associations. Everyone has within them an amazing capacity to change, adapt, and to thrive within a wide variety of conditions and environments. This has awakened new and exciting possibilities for individuals and cultures now being destroyed by traumatic and addictive behaviors. When
actually should the education and training to heal generation to generation traumatic behavior begin? When should the chain of pain onto others stop? How about now!

7.3 Cognitive-Emotional Wisdom in Education

What is the purpose of education if it is not to provide the tools and training for a successful adult life? And where is success without joy and passion? Can education be called a success if it does not provide the understanding and training of a personal cognitive-emotional system which has evolved for the actualization and maintenance of mental and physical health and well-being? Education should not be confined to developing a student’s cognitive skills without also understanding the emotional connection to happiness and joy needed to succeed in life. Cognition, physiology, emotions and consciousness have evolved together as a synergistic team. The nature and effective employment of these synergies should certainly be part of our educational curriculum. And this means teaching and developing the students’ skills and abilities to be happy and joyous within their endeavors.

Education must also be about training students to develop the wisdom necessary to function with an emotional system that has been evolving hundreds of thousands – if not millions – of years. The physiological biochemical response to cognitive activities of our reptilian brain are far different than the physiological and biochemical response from cognitive activities to our mammalian brain. To ignore the intricacies of an emotional guidance system is to disregard thousands of years of survival on the savannahs of Africa by our original human ancestry. This emotional guidance system now needs to be prepared and cultivated and nourished for successful operation within today’s technological world. This modern environment requires a new awakening and acceptance of an individual’s abilities to guide his or her own life.

The importance of physical education, sports, and even early-year recess in school is that it nurtures the cognitive-emotional relationship to physical health and well-being. We evolved to be active and these school activities reinforce the correlation between positive emotions and physical health and well-being. Encouraging healthful activity with the feeling of joy is
7.0 Cognitive-Emotional Wisdom

to promote this evolutionary correlation. Seeking joy and the feeling of well-being within
physical movement reinforces the physiological and emotional connection that has evolved
over millions of years.

Performing arts such as dance, theater, and music especially ask each participant to connect
with and to discover their emotional awareness. These disciplines require an exploration into
emotions. Instead of promoting a culture of emotional ignorance, they promote a culture of
emotional understanding and appreciation. This emotional awareness is a vital factor in
comprehending the alliances between cognition, emotion, and physiology.

Basic lessons in the understanding of and the application of one’s own emotional system are
vital. This means that our youth need education about how to develop joy in their lives.
Emotional wisdom is about taking healthful actions in joy rather than taking destructive
actions in anger. The capacity to perform the mental gymnastics necessary to pivot from
destructive to healthy mental and physical actions should be developed within early
childhood education to take full advantage of the brain’s neuroplastic behavior to reinforce
these habits.

Students must receive the cognitive training and skills to climb up the emotional staircase
from the lower emotions of rage and anger, to the higher emotional levels of frustration and
irritation, and finally to the pleasurable feelings of positive emotions. The failure to develop
this cognitive-emotional wisdom, where emotional evolution is ignored, can be directly tied
to our society’s violent behavior where movement up the emotional staircase is never
learned, developed, nor practiced. Like successful students in school, successful people in
life know how to use their emotions to guide their cognitive activities towards achieving their
goals and agendas.

We as a society have failed to develop the necessary education and training of a unique and
wonderful emotional guidance system. Many home environments don’t provide even the
basic emotional guidance understanding and training which creates a huge challenge to our
7.0 Cognitive-Emotional Wisdom

educational institutions. The consequences of such an ineffective emotional understanding within any cognitive behavior training can be readily seen in our prisons, our hospitals and the perpetuation of dependency on our welfare institutions. Violence and a failure to succeed in life is the result of an individual’s lack of understanding and appreciation of the cognitive-emotional connection.

The emotional guidance system has evolved to constructively guide individuals so that violence is a last resort response to the threat of immediate physical danger. The overhaul of our criminal justice system must start with an overhaul of our educational system and cultural values pertaining to understanding millions of years of emotional evolution and the nurturing of cognitive-emotional wisdom.

7.4 Criminal Justice Reform: The Unalienable Rights of Life, Liberty and the Pursuit of Happiness

The mental skills and agility that most people have developed from birth to navigate successfully through the societal nuances and intricacies of “what feels good is good” and ‘what feels bad is bad’ is largely absent in the tens of thousands of incarcerated people. Here, as a result of reinforcement of negative thought patterns with a misunderstanding of emotions as a feedback system, cognitive activity has never moved up the emotional staircase into the pleasures of successful and compassionate living. Any successful, sustained rehabilitation is also dependent on understanding the brain’s neuroplastic nature by our teachers, our parents, our schools, our religious figures, and by our politicians who are blindly, or maybe purposely, setting up rules and laws with punishments that only further degrade human intellectual and emotional wisdom and well-being. The brain can be rewired from an emotionally negative decision processing that accentuates destructive behavior to an emotionally positive decision processing that accentuates rewarding, useful and constructive behavior and results (Begley, 2013).

Why does society respond to unwanted behavior via punishment? Why is “spare the rod and spoil the child” such an ingrained euphemism within our culture? Why is punishment for
7.0 Cognitive-Emotional Wisdom

“crimes against society” considered to be just and humane behavior? Our current criminal ‘justice’ system only further desecrates our humanity and continues the cycle of self-destruction. It is time to stop the individual’s and society’s downward spiral into hell. Discussion and debate must move our concepts and resultant systemic practices and institutions out of our more reflexive reptilian brain and into our more compassionate mammalian brain where reality not only seems different, it is different. Different neural networks are assembling a different world.

Within this new world, punishment is not justice and human degradation is obscene. In this new world, empowering an individual to create their own, unique and wonderful world of joy is paramount. Here, society nurtures cognitive-emotional wisdom, the wisdom that finds a thought that feels better within a process that developed over tens of thousands of years of evolution and that is now etched in our DNA. Where is the society and culture that promotes cognitive-emotional wisdom education and training within our schools and prisons? Where is the society and culture that knows not of punishment, but understands the wisdom and freedom of joy? Every person has an emotional guidance system; its understanding and training must be part of our evolving moral culture. But we have a justice system entrenched in ‘punishment’ to bring ‘justice.’

Our system should be about justice, to be sure. But where is the justice if there is no understanding of, nor education and training to employ a very ancient emotional guidance system? Where is our government that was designed to protect our unalienable rights? How can our government perform its Constitutional mandate to promote the general welfare if it is not promoting life, liberty and the pursuit of happiness? To achieve this aim, we must promote the necessary understanding, purpose, and importance of an individual’s emotional guidance system – a biological system necessary for life, liberty and the pursuit of happiness.

Decision making and action from a negative emotional base has its evolutionary foundation within the reality of actual and immediate physical danger. To act from fear and anger within an emotional storm is to act without the benefit of the mental clarity and purpose found within an emotional calm. Reptilian life-and-death cognitive reflexes are for the
natural and artificial battlefields that have little to do with most behavior requirements within our modern societies. A person’s power of decision making comes \textit{not} from the emotional negative places of fear, anger, and despair, but from the emotional clarity found within peace, joy and hope. There can be no criminal justice without also providing the cognitive/emotional rehabilitation needed to succeed in society. And this means teaching a prisoner the wisdom in ‘the pursuit of happiness’! It is a ‘crime of society’ to believe that punishment is justice for criminal behavior. The rule of punishment reinforces and propagates an emotionally negative and destructive way of living. Is that to be society’s intent for our current criminal justice system? The lack of ethical decision-making skills within the cognitive abilities of incarcerated adolescents does not mean these people cannot be rehabilitated to practice new ideologies and behaviors later in life.

Who can predict the motivation, drive and desire of a person to return to the life of freedom and the life of well-being, joy, vitality, and enthusiasm for another day’s adventures even after years or even decades of imprisonment? Within a climate of doubt and disbelief of reform possibilities there may still exist within many individuals a flame of hope and the necessary drive to work and develop his or her cognitive-emotional wisdom and return to the freedoms and harmonies of joyous well-being. There is a moral duty and a Constitutional mandate for society to explore the possibilities and to give those imprisoned a chance to return to a naturally healthy life of freedom. There is a Constitutional and societal duty to explore, develop and learn about the mind-body-emotion-consciousness connection. Likewise, there is a Constitutional and societal responsibility to understand cognitive-emotional wisdom and the brain’s neuroplastic ability to change and to develop new neural networks that can redefine new perspectives, new alternatives, and new possibilities for successful living by our incarcerated brothers and sisters. Where is our government that was created to protect our inalienable rights of life, liberty and the pursuit of happiness? Where are the protectors of our Constitution for the welfare of all of humanity?
7.5 Reframing Antisocial Personality Disorder

Because of the brain’s neuroplastic nature to develop alternate networks, more advanced mental constructs of wanting and desire can develop as a person matures. The combination of internal physiological behaviors and the external physical exertion for survival also means a more complex development between the biological body and emotions. Movement to gather food or even to hunt on the African savannahs during humanity’s beginnings meant survival. Thus, a correlation between emotional pleasure and physical activity would be evolutionarily advantageous.

Although the joy of the hunt and the pleasure of gathering may produce the food needed for survival, during the heat of the day continual exertion risks heat exhaustion, dehydration and death. Rather than being a mere pawn of pleasure and pain, the individual must make decisions whether to continue to hunt in such adverse conditions with survival of self and family as one possible outcome and the death of the hunter and those dependent on the hunter’s survival as another. Or, maybe the hunter’s lone survival becomes evolutionarily advantageous.

Thus, neuroplasticity of the cognitive and emotional networks involves a complexity that permits cognitive reflection about the conditions for physical exertion and weighing of conflicting factors of feeling good while getting food versus feeling bad because of the day’s heat. The success or failure of these reflections and choices might spawn different genetic lines with different values and behaviors, such as one emphasizing the survival of the self and another emphasizing the survival of the family. One genetic line may care about other people; another genetic line may not. Therefore “antisocial personality disorder” would not be an actual disorder, rather, it would be a natural part of an individual’s evolution. Any successful interaction with these individuals – whether individually or as a society – must recognize and respond to their lack of any capacity for compassion, understanding, and kindness except when it pertains to their own well-being and interest.
7.6 Military Personnel Decommissioning

The power of the brain’s neuroplastic capacity to adapt to the demands of a new environment by changing and developing new neural networks is also demonstrated by the successful migration from civilian to military life. Unfortunately, this neural network change, which is developed to succeed in military life, is not later reconfigured for civilian life. There must be a structured ‘decommissioning’ period for military combatants that accounts for the neural network changes that allowed for success within a militarily structured environment designed for war. This wartime neural network must be reconfigured for a successful civilian life. Military life starts with a very well developed ‘boot camp’ that prepares a civilian for the new rigors and demands of a combatant. Where is the basic re-training that deprograms and alters the neural networks that formed while in active military service and that are now detrimental to civilian life? Where ‘commissioning’ personnel into military service has a long and rich tradition to produce successful combatants, surely it makes sense that the ‘decommissioning’ of military personnel with the new knowledge of the brain’s neuroplastic adaptive behaviors must be explored. Success can be measured when we no longer hear of homeless veterans or veterans who have given up hope and committed suicide. Military personnel are offered the most advanced and best training in the world to succeed in the most brutal of environments. They should also be trained to become the most advanced, best trained and most capable to succeed within the harsh realities of civilian life.

7.7 The Wisdom of a Champion: Let Joy Reign

The ‘Grateful Red’ (the UW student section) are stomping their feet in appreciation for the skillful play of their basketball team. Team execution has reached a new level of excellence. ‘Every’ shot is dropping, even more bizarre and – amazingly – a teammate is in the right spot for every loose ball, block, rebound or steal. There’s electricity in the air. It feels good! It feels great! It is wild. For team member and fan alike, this didn’t just happen; it began with a feeling, a positive good emotional feeling that grew and then exploded...lighting the nets on fire!
7.0 Cognitive-Emotional Wisdom

Evolution advanced a correlation between feeling good and a well-balanced and vital body. Emotional awareness of this, either consciously or unconsciously, meant survival. Those who acted without this understanding did not survive. To act without joy means the body is not in a prime physiological/biochemical state and simply does not have the harmony within itself to excel and perform at peak abilities. To physically compete at a peak physiological state, the emotional state cannot be negative, which means that consciousness must direct cognitive activity towards joyous being.

The mind-body-emotional game of any contest is about having the discipline to use the mind and all its cognitive abilities to find, to focus in on, and finally, to use the presence of good feeling emotions that proclaim a synergistic harmony of mind and body and being in the zone. “Do you feel ‘it’?” It being this mind-body-emotional zone of confidence, momentum, and an undercurrent of knowing success.

An athlete cannot play his or her best having an emotionally negative state of mind. The presence of negative emotions means that a well-balanced and vital body is not physiologically present. Physiological biochemical disharmony, felt through emotional dissonance, manifests directly from cognitive dissonance. Eye hand coordination will be off. Touch will be off. Execution will suffer. Mistakes are inevitable. Emotional negativity leads to injuries when the body is stressed and pushed to its limits during competition because the mind and body are biologically not working together as a unified whole.

The mental game of ‘being in the zone,’ ‘creating momentum,’ ‘being connected’ and ‘having confidence’ is about emotions, about good feeling emotions. There is no mental game, there is no mental focus, there is no confidence, there is no success, unless the emotions and feelings collaborate and acknowledge it. The mind, body, and emotions must work together as a synergistic whole – as the proverbial team – to bring forth an athlete’s best performance. This mind-body-emotional game is about cognitively bringing forth an emotional belief of success, which also brings forth by evolutionary necessity, the correlative physiological and biological foundation for success.
7.0 Cognitive-Emotional Wisdom

How much time in the off season has been spent in the gym to get the body physically ready for a long season of competition? How much time has been spent training one’s cognitive abilities to enter and sustain the emotional feeling of confidence and knowing of success and its correlative physiological and biological harmony? An athlete can easily name ten key conditioning and skill exercises they use to develop the body. How many athletes can name ten cognitive/emotional exercises they use to enter and to sustain the synergistic harmony of mind, body, and emotions necessary for success (see 8.2: Exercises in Cognitive-Emotional Rehabilitation).

Every moment throughout every day is an opportunity to train and to practice moving into a better and better feeling place of success. Every negative emotion is an opportunity to create a more powerful, emotionally positive mental attitude. Winning starts when each negative emotion is used as motivation to find a thought that feels better. Each of these successes helps develop the mental gymnastics required to respond to an evolved emotional guidance system with intent and purpose. The emotional system is giving constant feedback on whether ‘their head’ is getting into their game of success or into their game of failure. The question is, “does an athlete have the discipline to listen and the skills and training necessary to make the cognitive adjustments needed when the competition demands them?”

The mind-body-emotional play of a competition starts long before the actual game begins and must continue throughout any competition. Championships are lost because emotional guidance gets distracted from the final outcome and is sidetracked into the pregame publicity of yesterday’s success. Winning feels good but a tournament isn’t over with the semi-finals. A race isn’t won in the preliminaries. The competition isn’t over until it’s over. Now is the time for real mind-body-emotional discipline; to use the mind and its cognitive abilities to focus on, to recreate, and then to maintain an emotional background of previous successful competitive endeavors.

As I was walking through a grade school gym where I was substitute teaching, a very young and small boy wanted me to watch him shoot a basket. Amazingly, with his limited ability, he shouted with glee as his shot just hit the rim. He looked at me beaming with a smile,
obviously very proud of his success, and proclaimed, “it almost went in!” He had found the emotion of success where most would have only discovered failure.

The smallest of actions, a moment of brilliance, any second where “I feel it,” are all mind-body-emotional states of previous successes. It is a time when ‘that felt good!’ The Exercises in Cognitive-Emotional Rehabilitation of section 8.2 contains a list of exercises to recreate these mind-body-emotional states as fortification from any barrage of doubts, fears, uncertainties, and questions presented by an upcoming event. Recreate these mind-body-emotional states as a defense from the lure and illusion of a victory that doesn’t yet exist. Recreate these mind-body-emotional states as a reaction to any doubt and fear that squelches any inner harmony, peace, and enjoyment of competition. Recreate these mind-body-emotional states as an offense to the opponent’s barrage of jabs, hits and punches to assert ‘their’ dominance. Cognitive/emotional training starts in the off-season at home and continues each day and through each practice and right into the locker room and onto the court and throughout the game. Half-time is but an opportunity to reaffirm the joyous mind-body-emotional synergy of success. Too many half-time talks by the coaching staff disconnect rather than reinforce each individual’s and the team’s connection to strength, agility, coordination and power.

"If there are any doubters who don’t believe that we are going out and taking over the second half and winning this game, you can stay right here. We don’t want you. We don’t need you.” UW football player halftime speech to the team (paraphrased).

The audience may be watching and emotionally reacting to the action on the basketball court, but the real plays take place in the minds and hearts of each athlete. Which athlete is going to maintain their knowing of, and feeling of success? Which athlete will rise and overcome each challenge on who ‘owns’ this ball, these nets and this court? Which athlete will first feel the frustration of a missed shot or stolen ball or an opponent’s score and which team will first succumb to the gnawing fear of doubt? Every move and pass before a shot is time surgically utilized to assert self-confidence and domination. Pass the ball around to set up a shot but also to break down the opponent’s mental resilience and to assertively demonstrate
7.0 Cognitive-Emotional Wisdom

to them that “we” control this game. We own this game. We are enjoying this game. Our bench is enjoying this game. We are winning this game no matter the current score. “Do you feel it? Good! Take the shot.”

Emotions are responses to all that activity going on between the ears. They are an ever-present coach that lets each athlete individually know where his or her mind’s activities are heading. The better the feeling, the more mental activities are in your game. The worse the feeling, the closer mental activities are to getting lost in your opponent’s game. The question is, how much time and energy has been devoted throughout an athlete’s career to understanding and appreciating the cognitive/emotional game necessary for success?

Any break in the action provides a moment to utilize the months and years of cognitive/emotional training and exercises and to stop and step up the emotional staircase. That is, if in despair to move up into anger; if in anger, to move up into frustration; if in frustration, to move up into hope; if in hope, to move up into the joy of believing; if in the joy of believing, to move up into the excitement of knowing…. of success! “A time out is an opportunity to get your mind, your body, and your heart into the moment of your event. If you learn how to take the time to own each competitive event and to make those moments in time joyously yours, then any event throughout life can bring joy and must become yours.”

7.8 Emotions in the 21st Century

The purpose of life from a physiological, biochemical perspective is to find joy. A correlation exists between joy and the biochemical balances found within the brain’s neural networks and the body that makes for a strong and vigorous being. Has not that been the evolution of the emotional system? A false/positive correlation between joyous emotions and lethargy, weakness, and ineptness would only make a being vulnerable and easy prey within the survival of the species. Joy, happiness, and wonderment associated with biochemical harmony of strength, confidence, skill, and agility, on the other hand, would clearly enhance the survival of the species.
7.0 Cognitive-Emotional Wisdom

Genetically, humans are wired to feel good emotionally. The very strength and survival of the individual depends on striving for better feelings and what those feelings represent within the body. It is our evolutionary nature. But we do not thrive as individual beings without the societal strength to create and empower the development of cognitive-emotional wisdom, where individuals learn, develop, and know how to respond to their own individual emotional guidance with healthful and joyous actions and behaviors.

It is necessary to elaborate on some important distinctions which need to be made in our 21st century consumer-focused society. Sugar may have wonderful ‘feels good’ associations but gaining weight is probably not one of them. Shopping may feel good but getting the bills may not. Having a brand-new car feels great, but the consequences of it being a stolen car does not. The same ‘feels good’ but ‘know the bad’ goes for drinking, drugs, medications and all of human behaviors. Knowing what actions may feel good and knowing what consequences may feel horrendous is a product of the cognitive mind and the emotional perceptual system of the body’s biochemical physiology. On the other hand, society’s acceptance of such action often impacts a person’s attention to their own emotional guidance: what if a person’s behavior aligns with emotional guidance but this behavior is contrary to accepted societal norms? And conversely, what if a person’s behavior aligns with emotional guidance but this behavior should be contrary to accepted societal norms?

Where is the emotional wisdom in a ‘feels good is good’ behavior model? The correlation between the better one feels and the healthier one is, began evolving millions of years ago. In question are emotions’ guiding relevance in the 21st century and beyond. Emotions are only reflections of cognitive activities via their correlative relationship to biochemical physiology. Therefore, it is not emotions, but cognition that is in question. The power of cognitive-emotional wisdom lies within one’s abilities to meet the challenges of today’s complex societies by transmuting life’s pains and failures, via cognitive work and imagination, into the thoughts and actions that both feel good and are integral and harmonious to a self and that does not demand the obedience and subjugation of others but promotes the welfare and empowerment of others. This means moving out of the more
7.0 Cognitive-Emotional Wisdom

reflexive reptilian brain and into the more compassionate, complex capacity within the
mammalian brain. Joy and happiness, if dependent on the requirement and demand for
specific behavior in others, is an attempt to appease a false ideology. It can never succeed.
To make joy and happiness dependent on others’ behaviors is to deny the evolutionary role
of emotional guidance. Emotional guidance and cognitive-emotional wisdom are self-
management tools.

   the Frontiers of Neuroplasticity*. New York, NY: Viking

8.0 Cognitive-Emotional Therapy

For those who are not enjoying their ride in life and for those who can’t comprehend how anybody can possibly say “it’s all good,” may I recommend that you start using your emotional system as it has evolved to be used. You will get to a place where, “Yea, I can understand how that makes sense, it IS all good.” It is very unfortunate that the most influential people in a person’s life may have imparted an impoverished attitude about life. But attitudes can change. The neuroplastic brain can grow new circuits of understanding and awareness and provide you with new understandings, awarenesses and abilities to meet the challenges of life – if you put in the effort. When I came to the point in my life that I understood “where I am is not my fault but it is now my responsibility,” that is when life started getting better for me. It takes effort. But if you have the desire to improve and empower your own life, start using your emotions, and understand that if a thought doesn’t feel good, it’s not. If what you are doing in life doesn’t feel good, it isn’t good, for you or anybody around you. You have to become your own ‘superhero.’

Cognitive-physiological-emotional well-being means: 1) having the ability to evaluate one’s own cognitive activities with one’s own emotional system, 2) having the ability to STOP…and respond to this evaluation, 3) switching from emotionally-negative cognitive activities to those cognitive activities that will elicit positive emotions and, finally, 4) using these new emotionally-positive thoughts as the basis for constructive action. Cognitive-emotional therapy is about developing the cognitive skills and habits necessary to harness the emotional guidance system for the purpose of attaining mental and physical well-being by gaining new perspectives of people, places, and events. With this new perspective, new opportunities to act and function will be unveiled that were previously masked by old and emotionally negative cognitive habits. And most importantly, such revised cognition causes a person to actually feel better.

Negative emotions are very important, in fact, they are fundamental parts of the healing equation. Negative emotions are the lower steps of the emotional staircase. Positive
emotions are the higher steps. Negative emotions bring an awareness of that which is not
wanted (bottom steps) and are used to identify that which is wanted (top steps). The problem
and the solution are part of the same staircase. Engineers, for example, have problems to
solve. But engineers don’t fixate on what’s wrong. They have the unique ability to use what
is wrong and not wanted to generate solutions. Solutions become more apparent after
silently exhaling and quieting the knowing and fixation upon that which is wrong. “Be still
and listen…”

The objective of cognitive-emotional therapy is to attain mental and physical health and
well-being. This starts with learning how to feel better emotionally. The role of the caregiver
is to help pave the way for the patient to move up the emotional path. How far along the
path a patient travel depends on his or her motivation to take another step: take one more step
just to feel a little bit better. One step may take a month. It may take two. But no matter the
time, the cornerstone role of caregivers is to help patients take that next step with the promise
that when they do, they will feel better. At first, feeling better may simply translate into
feeling less pain. Eventually though, over time, with the development of new cognitive
habits, emotional feelings will transcend from negative to positive.

8.1 Motivation to Feel Better

The answer to the question “how do you feel” depends on what that person is dwelling upon
mentally. Questions such as “tell me, what is going on,” “what is happening” or “what’s up”
coupled with follow up questions such as, “how do you feel about that” or “how does that
make you feel” are appropriate questions to ascertain the current emotional-thought
correlations. The reason for asking these questions is to help a person begin to understand
and acknowledge the correlation between emotions and mental activities.

Answers to these questions will also help the therapists find the desires within their patients’
mental-emotional jungle. These desires can be harnessed as motivation to alter a patient’s
current, negatively charged patterns of thoughts and actions into patterns of thoughts and
actions that feel better. The question “what do you want” develops focus. An answer
demands a “fearless sifting and winnowing” (Wikipedia, Sifting and winnowing) of thoughts, experiences and desires, and a focus on that which is wanted and its associated positive feelings.

Whatever a patient’s desire may be, there is an underlying desire to feel good, to feel better. This desire is an important motivation to do the work necessary for improvement. Feeling good is also needed for activating the underlying neuroplastic changes in the brain that will lead to a new, different and improved lifestyle (Gorwood, Corruble, Falissard, Goodwin, 2008).

To feel good, to feel better, to get well, to have a life and to enjoy work and play requires a person to use his or her own emotional system to change current habits of thought. Work and action are necessary to not be angry, sad, disappointed, depressed, and to lessen the emotional pain and move out of the depths of despair. Do you want to feel better? If the answer is yes, then here is where you can start: do something for yourself everyday – something constructive – that helps you feel a little better or feel a little less bad.

### 8.2 Cognitive-Emotional Rehabilitation and Strengthening Exercises, aka, Wellness Training (Your Superhero Toolkit)

All these tools are methods for changing destructive and aberrant cognitive activities into constructive and useful cognitive activities. This list of tools is, by any means, incomplete. As Aurobindio Ghose states in The Synthesis of Yoga “all life is yoga” (Ghose, 2015) and even work itself qualifies as a means to develop one’s cognitive muscles. Qualified experts are readily available in all these areas of endeavor. Emotions act as a guide because emotions give cognition feedback via their perception of the body’s physiological and biochemical state of being. These body conditions are generated by the cognitive activities of the reptilian and mammalian brains. Awareness of whether emotions are basic responses to reptilian cognitive activities or responses to complex mammalian cogitative activities, aids in the understanding that some tools will be more effective than others. Rather than
8.0 Cognitive-Emotional Therapy

understanding the differences in basic and complex emotions, it is far more important to
develop an awareness of what is working and what is not working for you to feel better.

8.2.1 Focusing on That Which Is Wanted

“What do you want?” is a question to bring focus and to identify a subject of desire and to
bring forth positive emotions. A person knows when they dwell upon ‘that which is wanted’
when positive emotions come forward. Negative emotions come from ‘looking at’ or
‘dwelling upon’ such people, places and events a person doesn’t want. “You have told me
what you don’t want; now tell me about what you do want.” The presence of positive
emotions within the conversation may be attributed to success in changing the subject from
the ‘lack of that which is wanted’ to the ‘presence or refocusing on that which is
wanted.’ Continual discussion around these emotionally positive subjects lays the
foundational touch stones for moving up the emotional staircase where more joyous and
healthy activity resides. At first these touchstones may be just less painful. Yet, with
continual work, movement up the emotional staircase will eventually bring emotionally
positive results.

Individuals can’t focus on what they don’t want and simultaneously have positive emotions.
We may use positive words, but if the emotion behind our words is still negative, nothing
changes. When words and phrases are positive but the emotional state behind such words
remains negative, mental activity is still negative and unhealthy. The emotions connected
with the mental activities are the guiding factor or, more precisely, the physiological
biochemical alterations produced by cognitive activity that consciousness perceives as
emotions are the guide. Focus and awareness need to be on the emotional state. When it
changes from negative to positive, positive-sounding words become honest and in harmony.
The conversation revolving around a subject now leads towards health and well-being. The
challenge is to continue to modify the attributes of the conversation in this healthier direction
and to bring forth more and more positive emotions.
8.0 Cognitive-Emotional Therapy

But the engineering mind and the gamer mind (as in chess) seem to develop positive emotions while identifying and holding a problem in stasis, while searching for and allowing solutions to ‘come to mind.’ The design of the prefrontal cortex seems to be integral to this process. It functions by holding ‘what’s not wanted’ – which stimulates negative emotion – in the right prefrontal cortex and the desired outcome of ‘what’s wanted’ – which stimulates positive emotion – within the left prefrontal cortex (Davidson, Begley, 2012). The precise nature of these prefrontal cortex activates needs further research.

8.2.2 Reframing and Appreciating

To appreciate a person or persons means to find something of “value” within them to focus on, which stimulates positive emotional responses. To appreciate a situation means to find something of value within the situation to focus on. Appreciation means to make the effort to dwell on some emotionally positive aspect of a person, place, or event that brings about good emotional feelings. “This rain means we can’t go for our walk, but we can catch up on our reading.” The subject matter doesn’t change. It hasn’t stopped raining, but the rain’s positive attribute is brought forward and the emotional state improves. Or as the saying goes, make lemonade out of lemons. The issue is found in the lack of understanding within these common phrases: ‘it is good’/ ‘it is bad’ or ‘it makes me happy’/ ‘it makes me sad’. All these common phrasings misplace the responsibility ‘I’ have in creating ‘my own’ emotional state of being.

One type of reframing is to step back from the emotionally negative subject of a discussion and to take a more general view. Instead of looking at the overwhelming task presented by the thought that ‘my whole house is a mess,’ reframe the massive task of cleaning the whole house into a practical task of cleaning one room or one corner, or even to start with a drawer. A rose is a very beautiful flower but if you only see the thorns it is an entirely different plant.

Listing the emotionally positive attributes of persons or events requires the work and effort needed to use emotions to guide one’s focus from emotionally negative aspects to emotionally positive aspects. But once these emotionally positive attributes are identified and

*Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness* (rev2020-01-23a)
8.0 Cognitive-Emotional Therapy

they become first in a series of thoughts, the actions and events which follow will become healthier. Remember, the primary goal in these exercises is to bring about emotionally positive cognitive activity which correlates with a healthy lifestyle. Appreciating nature is a wonderful method for extricating oneself from the harsh ‘realities’ of a negative world and into another, no-less-real ‘reality’ of the beauty and marvel that also exist in our world.

8.2.3 Touchstones

Any object can be a reminder of an emotionally positive moment. Pictures, for example, are very common keepsakes, as are cards and clothes. Songs and music have a special way of activating thoughts and mental activities and their emotional responses. Helping a person to understand how objects can draw out emotionally positive thoughts is but one aspect of emotional rehabilitation. But objects, events and even certain smells can also quickly bring back memories of a painful experience. The opportunity to stop old habits of thought and to develop new habits of thought presents itself many times throughout the day. Years may have been spent building an emotionally negative vortex of depressing thoughts and behaviors. Daily negative flashbacks are a burden. But each flashback is an opportunity to take another step up the spiral staircase and to develop healthier habits of thought.

8.2.4 Acts of Kindness

A healthy lifestyle means to live – and to act from – an emotionally positive place. An emotionally positive action develops a pathway to a healthier lifestyle. One method to bring up the emotions of a positive lifestyle is to perform acts of kindness. This extends the mental exercise of appreciation outward and into the world. It begins the unveiling of a new life of well-being. A kind act may be as simple as petting a dog or a cat, smiling at a waiter or waitress, cleaning a room, or washing a car. The good feelings of a kind act toward others make the reality of an emotionally positive world more real. It stands as a great contrast to the emotionally negative world that a person is trying to leave behind.
8.0 Cognitive-Emotional Therapy

8.2.5 Distractions

Sometimes reframing may be too difficult. Then, instead of continuing to fixate on a subject of angst that is just too unyielding to remold into a better feeling accord, it may be time to step away from the subject and to mentally dwell on something else. The object here is to radically change focus and to completely distract the mind and its current unproductive activities onto something that provokes emotionally positive feelings. Go to a movie. Read a book. Enjoy a bike ride or a walk in the park. If the emotions improve then the distraction is working. The subject of angst can then be re-approached with a clearer head.

An odd correlative approach is to go to a more emotionally negative movie. The old unyielding cognitive activities have now been displaced onto a different scenario – the movie – from which it may be easier to emotionally reframe into more positive emotions. But this could also go the wrong way…

Going to a bar for a few drinks with friends may seem be a very effective means of distraction, but much too often this distraction, just like drugs and medications, may be seen as the final solution, and the subject of angst is never re-approached and resolved.

8.2.6 Meditation

Meditations, of which mindfulness is one type, are healthful activities whose function is to remove consciousness from the mental chaos generated by daily life. Some meditations, like focusing on one’s breathing or on a spot on one’s forehead, work on slowly quieting the thought processes. The key is not to latch on or fixate upon a thought but to allow a thought to pass through the mind. More mentally active, guided meditations take place when someone leads the thought process. Yoga and tai-chi are even more active meditations that involve the body. Running, biking, and rowing are activities that may also have the meditative quality of quieting the mind. Monitoring the emotional state is the key to the effectiveness of any meditation.
8.0 Cognitive-Emotional Therapy

These methods of calming the mind and ‘emptying it of thought’ are a means to allow more emotionally positive thoughts to replace the old. A person will feel better because mental activity has been removed from the subject of angst, but the real fruit of this labor comes when new, more emotionally positive thoughts are allowed to grow and prosper. It is always necessary to quiet the mind to allow room for these new ideas to sprout and grow.

8.2.7 Sports

Within the educational curriculum, organized sports provide great opportunities to promote lifelong mental health and well-being in addition to the obvious benefit to the body. For most student athletes, performing well is their top priority and focus. Enhanced physiology for peak performance is a function of feeling good which correlates with a cognitive knowing of strength, vigor, and adeptness and an actuality of strength, vigor, and adeptness. Feeling good means adherence to a strict protocol of utilizing the emotional guidance system to evaluate one’s own mental activities. Although over excitement may bring forth good feelings, it is indicative of a new biochemical physiology that has yet to be integrated into a harmonious synergy of mind, body, and emotions needed for competition. Negative attitudes and nervousness hinder an athlete’s performance potential. Negative emotions indicate an altered neural circuitry and a diminished biochemical balance from that found within the natural performance-enhancing attitude of feeling good and the presence of strength, coordination, and empowerment. Record-setting performances come from a physiology found within emotionally positive states of being. An athlete’s whole life will benefit from the cognitive skills and training developed to utilize the emotional system for physical performance enhancement during athletic competition.

8.2.8 Music and the Arts

Training in music and the arts is significant in that these disciplines reach into the emotional system and give emotional perceptions an outward expression. The processes of reaching in and identifying emotional states is a significant step toward working the cognitive/emotional symbiotic relationship. Music can provide an opportunity to bypass confused and
8.0 Cognitive-Emotional Therapy

convoluted cognitive activities and make available a direct link into the inner harmonies of well-being. Music and the arts can distract the mind into a better emotional place. In some cases, they can also promote agitation, anxiety, nervousness and apprehension. But most importantly, music and the arts can activate and promote pathways towards a sense of peace and connection into a more harmonious, healthy, and useful consciousness.

8.2.9. Creative Writing and Writing Memoirs

Creative writing and especially writing of one’s own memories can be very therapeutic by reconstituting past traumatic events into new healthy and prosperous cognitive-emotional behaviors with resulting new and constructive physical behaviors. Writers would benefit from an instructor with strong psychological and therapeutic skills to safeguard from personal wallowing and accentuating old and traumatic events rather than using these events as steppingstones – or spring boards – into emotionally positive desires, visions, and dreams. Writing and bringing old traumas to the light for others to read should be just that, bringing trauma into the light where these events are exposed for personal purposes of self-transformation into a new, exciting and healthier life style where the mind, body, emotions, and consciousness harmoniously work together to bring a new peace, happiness, and joy.

8.2.10. Stop Going There

Maybe a subject is so vast and unyielding that the only solution is just to ‘not go there.’ There is no solution, viewpoint or aspect that elicits positive emotions. Avoidance may not be ‘how I was brought up’ or ‘politically correct’ but it may be important for a person’s health and well-being. “That is not your problem” may be the best advice a therapist can give for developing a patient’s health. There is an important lesson here in valuing personal health and well-being and the role of the personal emotional guidance system over the values imposed by society and others. For example, fixating on world hunger can become overwhelming. If a person isn’t able to view or evaluate such a subject and emotionally feel good about the ‘good’ they can do, perhaps it is a subject for that person to put aside.
8.0 Cognitive-Emotional Therapy

8.2.11 Having Compassion for Self

Many people can manifest compassion for a person or animal that is having a difficult time, but they fail to feel compassion for themselves. “Give yourself the same compassion you give to others and stop using your own mind to beat yourself up. Do these thoughts feel good? If not, let us work together and find ways to stop this self-inflicting torture.”

8.2.12 Using Religious Ideals

“to Walk within God is to Walk within Joy”

There are many aspects of the world’s religions that pertain to easing the mind of its burdens. There are the Sufi dances of peace; there are the Hindu practices of yoga which means union with God; and there are the Buddhist meditations for enlightenment to reach Nirvana and the cessation of suffering; and the songs of Jewish cantors or Christian chants have a similar effect. Religious practices can be explored with patients who are so inclined. Personal emotional awareness and wisdom are important because within religion are also ideas and beliefs that, rather than bringing about an experience of salvation and peace, simply invite “hell on earth.” Emotional guidance is about controlling one’s own activities, not about controlling others.

“Let go and let God” or “trust in Allah” are just a couple examples of how religious beliefs can be used to bring about emotionally positive cognitive activities. The subject of forgiveness may be about someone and their transgressions but, most importantly, forgiveness is by and large for the injured. Forgiving someone is an act of letting go of a past experience so that a new life may begin. Forgiveness is a way for a person to move on with life so that they may be “reborn” into a better existence. Other words of comfort may include:

1) “When I let go of what I am, I become what I might be.” Lao Tzu
   (brainyquote.com)
8.0 Cognitive-Emotional Therapy

2) “May God console you among the other mourners of Zion and Jerusalem
   (Ha’makom yenahem etkhem betokh she’ar avelei Tziyonvi Yerushalayim).”
   (myjewishlearning.com)

3) “Sadness is the heart telling you to find Allah. Depression is not listening to your
   heart. Comfort is remembering Allah is always there.” Yahya Adel Ibrahim
   (islamicquotesdb.com)

4) “The LORD is my shepherd; I shall not want…” Psalm 23 (King James Bible)

5) “Wherever you go, go with all your heart.” Confucius (goodreads.com)

6) “Happiness radiates like the fragrance from a flower and draws all good things
   towards you.” Maharishi Mahesh Yogi (brainyquotes.com)

7) “There is no path to happiness: happiness is the path.” Gautama Buddha
   (quoteideas.com)

8) “Before becoming a Sikh, a Muslim, a Hindu or a Christian, let’s become a human
   first.” Sri Guru Nanak Dev Ji. (https://beartales.me)

8.3 Cognitive-Emotional Wisdom in Therapy

Emotions have value. They are important. But to have value and to be important emotions
must be used as they have evolved. The presence of negative emotions did not evolve to add
fuel to the fire and escalate emotionally negative situations accelerating the emotional
downward spiral. Like a runaway train down a mountain, there is not going to be a good
outcome. The question is, can a person become the observer-self? Can the person separate
him or herself from the pathos of the moment….and STOP (Dubic, The Brain), (Goleman,
Davidson, 2017)? Can the therapist help a person become empowered to stop, and act upon a
negatively charged situation in a more emotionally positive direction? The quicker one
8.0 Cognitive-Emotional Therapy

realizes that they are on a run-away train, spiraling out of control, the easier it becomes to
stop the downward and emotionally negative train of thoughts and actions and to start back
up the emotional staircase.

Much of a person’s negative emotion comes from dwelling on the undesirable actions of
others. Try telling someone who is angry at someone to look at what thing want in order to
feel better and that angry person may reply, “I will feel better when I punch him in the face.”
Or, “when my brother stops doing that, then I will feel better.” That is, when the proverbial
“they” stop doing “whatever,” then “I” will feel better. To depend on someone else’s
behavior changing in order to feel better is a trap. It requires that every person in the world
who doesn’t do as you like must change. Is that really a reasonable expectation? The need
for action can and should be satisfied, but action from a positive emotional place is far
different and more effective than action taken in anger.

Cognitive-emotional wisdom isn’t only about moving up the emotional staircase when
circumstances and events are conducive to upward movement, it’s also about having the
discipline and fortitude to resolve the internal struggles and to create the mental and
emotional harmony necessary for action when circumstances and events are not conducive to
upward movement. Too many people have the unfortunate life circumstance in which the
motivation for stopping the emotional-downward spiral into self-destruction only develops
from having already personally followed this path into a barren, despondent wasteland. It is
the fortunate few who work and regain their evolutionary roots and relearn how to act from
an emotionally positive platform.

A person may have to focus only on a very narrow and constrained view of the world in
order to access and use his or her emotional guidance. A person’s world view may be limited
to a back yard or to the shadows on the bottom of a pool of water. But as healing occurs,
broadening the understanding of how to use emotional guidance in an increasingly vast and
complicated world becomes possible and necessary. Developing the cognitive-emotional
ability to function in society is one measure of health. A greater measure of health and sanity
8.0 Cognitive-Emotional Therapy

is to actually enjoy the opportunities society offers. Tens of thousands of years of human evolution have developed within our species the capacity to use our emotions to guide our cognitive behaviors towards a life of health and well-being.

9.0 Emotional Guidance - The Dark Side

Good and bad feeling emotions are the perception by consciousness of the body’s/brain’s biochemical physiology precipitated by cognitive activities.

Emotions have evolved over millions of years into a discernible identity for all living species not only to survive, but to thrive within this planetary existence called Earth. A parallel process, cognition, likewise, has been evolving into a discernible identity. But, the symbiotic relationship between cognition and emotion, which had become so successful within the multitude of species over Earth’s history, somehow has become convoluted within humanity’s cognitive construct of this unique and wonderful relationship.

9.1 The Grand Illusion Feeding the Dark Side of Emotions

Humanity’s current cognitive construct of emotions is illusionary. Emotions cannot overpower reason; emotions are the result of reason. Note that the meaning of emotion from the Oxford Living Dictionary, (Oxford Dictionaries, Emotion) “A strong feeling deriving from one’s circumstances, mood, or relationships with others” does begin to catch this cognitive/emotional relationship. But their following sentence examples seem to reaffirm emotion’s independent ‘stand-alone’ status:

- ‘She was attempting to control her emotions’
- ‘He began to drink heavily and seemed quite incapable of controlling his emotions. How could she have let him do this to her, to affect her this way so that she had no control over her own emotions?’
- ‘He said the crash had devastated the entire station and emotions were still raw.’
- ‘When he does react, he makes sure that his rational side is always in control of his emotions.’
- ‘Her emotions were too strong, too raw, for her to be able to suppress them any longer.’
9.0 Emotional Guidance – The Dark Side

- ‘He said he could never condone her reaction but her emotions were understandable.’
- ‘She loves the fact that there is an intensity about holidays that can spark strong emotions.’
- ‘She hated letting other people see her cry, as if it was a point of shame to possess human emotions.’
- ‘There has been an attempt to defuse aggressive emotions and any desire for revenge.’

Wikipedia, along with an extensive discussion, sums up this illusionary nature of emotions by: “Emotions produce different physiological, behavioral and cognitive changes” (Italics mine for emphasis) (Wikipedia, Emotion).

All the previous sections of this book have been an argument and explanation of a different cognitive construct of emotions: “emotions are consciousness’s perceptions of the body’s biochemical physiology precipitated by cognitive activities.” Thus, the construct that emotions produce various physiological, behavioral, and cognitive changes is a red herring for our psychological, psychiatric and pharmaceutical detectives. And most importantly, their patients and the mental health profession suffer greatly with the perpetuation of this grand illusion as ascribed to by most of humanity.

9.2 The Emotional Guidance of “What Feels Good Is Good”

To recapitulate what has been stated earlier, the cognitive construct of emotional guidance evolved out of the necessary correlative relationships between cognition, biochemical physiology, emotions and consciousness that promoted life throughout the ages. In the most basic biological sense, this means that “what feels good is good”. That is, cognitive activities that support a healthy, vital, and vigorous biochemical physiology must feel good. Any cognitive activities that depress health, well-being and survival that would also correlate with the conscious perception of good feeling emotions instead of bad feeling emotions, would promote behavior contrary to the existence of the species. This basic biological play between good and bad feeling emotions grows extremely complex as humans have evolved.
9.0 Emotional Guidance – The Dark Side

an extensive and intricate cognitive neural circuitry to manipulate a multitude of cognitive facets and reflections of constructs, concepts, knowledge and awarenesses. But, no matter the complexity, the basic evolutionary correlation of health and well-being rests upon conscious manipulation of cognition and a return to good feeling emotions. Using one’s own emotions to evaluate one’s own cognitive iterations is called emotional guidance. The skill and gymnastics to manipulate these cognitive intricacies into joyous health, well-being, power, and freedom for self and others is called emotional wisdom.

9.3 Emotional Guidance Gone Wrong

Often nature’s wonderful cognition, biochemical physiology, emotions and consciousness correlation relationships have gone astray. Humans have evolved to be happy, joyous and healthy beings. Yet, this is far from our current status quo. An introduction to the how, where and why nature’s emotional guidance can go wrong is discussed in the following paragraphs.

9.3.1 Aberrant and Destructive Emotions

The “modern” psychological cognitive construct of emotions believes in aberrant and destructive emotions. The premise of cognitive behavior therapy declares that emotions “produce” physiological biochemical changes rather than that they are the perception of physiological biochemical changes. According to this view, emotions are bestowed with a causal property such that they are falsely understood as aberrant and destructive – or the opposite – normal and constructive, and thus their evolved power of guidance is obfuscated. Thus, instead of emotions being used to guide cognitive activities, they are treated as a dangerous disorder that must be managed and controlled. This illusionary construct is ignorant of (1) the dependent nature of emotions on the cognitive processes of knowing, namely, perceiving, recognizing, conceiving, and reasoning (Encyclopedia Britannica, Emotion) and (2) the influence of this cognitive activity on the biochemical physiology of the body/mind, which (3) activates the emotional neural networks of perception.

Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness (rev2020-01-23a)
9.3.2 Emotional versus Cognitive Disorder Management

The whole content of this book is to empower individuals to use the evolutionary nature of their emotional guidance. Ignorance of this evolutionary attribute of emotions has led to erroneous cognitive constructs of emotional disorders and hysteria that overpower reason, which has resulted in a pharmaceutical approach to manage and control emotions. More insidious is the cognitive construct of cognitive management of emotions by which emotions are deemed to be empowered with a force and influence they do not have.

Yes, emotions change with the change of cognitive behavior in both cognitive behavior therapy and emotional guidance training, but the difference lies within the intent of these disparate theories. Within cognitive behavior therapy, emotions are in disorder and in need of management and if emotions cannot be personally managed, then pharmaceutical management of emotions is warranted. But, to artificially sedate and manipulate emotions is to falsify and distort consciousness’ perception and awareness of the body’s biochemical physiology and thus, to falsify and distort the very awareness of the cognitive behavior or activities that this therapy purports to utilize for healing. This can generate a vast disconnect between emotions, cognition, and resulting behavior. This truly is creating insanity.

The intent of emotional guidance is to use emotions to guide cognitive behavior because emotions are reflecting the consequences of cognitive behavior on the body’s biochemical physiology: any disorders and chemical imbalances or neural network abnormalities are due to these cognitive activities. If cognition cannot be personally manipulated with one’s conscious awareness of own’s own personal emotional state, then it is cognition that must be pharmaceutically managed, rather than emotions. What is retained in emotional guidance therapy is not a distortion but an honest and accurate emotional feedback of cognitive behavior or activities.

Of course, emotions can be sedated and artificially manipulated with chemicals or electronic implants. However, consider the analogy to using chemical pain management when setting broken bones after extreme physical abuse. Pain is a necessary consequence of physiological...
harm and abuse. Not knowing if one’s leg is broken would have dire consequences. Artificial pain management may be necessary during healing, but with these pharmaceuticals, there is also a keen awareness of further physical abuse and damage because of the lack of honest and accurate pain feedback. Similarly, any artificial emotional management must be temporary and come with the keen awareness of continual and unrealized cognitive self-abusive behavior because of the lack of honest and accurate emotional feedback.

9.3.3. Medication Addiction: Inertia – a body at rest…

How easy is it to come up with an excuse to not to go to the gym for some needed exercise? Exercise is wonderful for the body. Likewise, emotional guidance may be encouraging a change in cognitive behavior, but how easy is it to take a drink and numb the senses instead of exercising a change in cognitive activity? Contrary to the interest of the pharmaceutical industry, millions of people successfully self-medicate this way and manage to navigate the potential pitfalls of addiction. But finding a successful prescription which acts only as a temporary cognitive/emotional band aid is not in the fiscal interest of the current pharmaceutical industry.

How easy is it to avoid the effort needed to question one’s own thoughts and values and to rework a lifetime of so-called ‘useful’ core beliefs? A psychiatrist explains to you that, “your condition is the result of an illness. You are not at fault, but you must be responsible and take care of yourself and learn to manage your illness. Your responsibility is to now take these medications for your own benefit, maybe/probably/definitely for the rest of your life.” Your doctor doesn’t question their years of education, training and the millions of dollars spent on researching and reinforcing the paradigms of affective disorders, diseases, and illnesses. Who are you to question the seduction of pill therapy, which is only further reinforced when these drugs camouflage any emotional dissonance that existed as signals that you need to alter your own cognitive behavior? And to further dilute your powers of emotional guidance, the pain and agony of chemical withdrawal because of biological
addiction and the ensuing suffering from not taking certain medications and drugs can be the final blow to the freedom and empowerment emotional guidance would otherwise promise.

9.3.4 Self-Indulgence

An observer asks, “Why do you hit your thumb with a hammer?” “Because it feels so good when I stop!” is the reply.

The pain of self-cutting and self-burning creates a distraction from an internal emotional pain. It is also symbolically broadcasting outward this internal and hidden emotional pain. Emotional pain does not broadcast a need for sympathy and understanding to the world like a broken leg does. Also, “…it feels so good when I stop!” is an intuitive awareness that “my emotional pain should stop so why doesn’t it?” Why is it obvious that the self-abuse and pain from hitting your thumb with a hammer will stop when the behavior stops, yet the same concept is not understood with cognitive self-abuse. Emotional pain is telling you to stop beating yourself with your proverbial cognitive hammer.

Merriam-Webster defines self-indulgence as: excessive or unrestrained gratification of one's own appetites, desires, or whims. This definition promotes the view that a self-indulgent person dives in and explains, expounds, and continues the emotional roller coaster ride by allowing their emotions to drive cognitive behavior. On the contrary, it is cognitive behavior which further drives and embellishes its own cognitive vortex, thus accentuating an emotional feedback reverberation loop. An emotional roller coaster may be fun at a concert, play, or show when it is enhancing emotional joy, but if the same uncontrolled self-indulgence activates hatred, envy, anger, depression or some other emotionally negative pattern of thought, it can be a disastrous ride through hell, very possibly resulting in a tragic ending of death/suicide.

Along with learning how and when to get on an emotional roller coaster for entertainment is the necessary knowledge and skill to get off and stop this self-indulgent cognitive behavior when desired. Also, allowing a book, concert, or play to drive cognitive emotional behavior
for entertainment is ethically different than allowing a salesperson or politician the same
unrestrained control and influence.

9.3.5 Camouflage, Deception and Trickery

The power of millions of years of evolution is within your emotional guidance system. Yet
this power is a challenge to others who need your servitude for their own edifice. Culture,
society, religion, government, education, psychology and your parents are major influences:
within their weaknesses they impart weakness; within their strength is the possibility to
educate, teach, and train emotional empowerment.

Camouflage, deception, trickery, entrapment, and many, many other cunning devices have
evolved throughout the natural world and so to find these within humanity should be no
surprise. Who has not been given a very believable sales pitch from an apparently honest
and respectable person, only to be had? Sales and marketing have become a very powerful
force of human nature. Affective realism is the concept that the emotions that I feel when
observing an event, person, or object are also believed to be an inherent and intrinsic truth or
property of that event, person, or object. Sales and marketing have become masters at
creating the illusion of feels right for their own selfish interest and gain even to the detriment
of their customer. This deception of personal emotional guidance must be acknowledged,
understood, and be part of emotional guidance training and development within our
educational institutions.

9.3.6. Affective Realism Gone Really Wrong

A father hires a nanny for his daughter and the nanny turns out to be a sexual predator. The
daughter keeps silent and her abuse goes on for years. The father, a very successful
businessman and powerful lobbyist, rather than accepting responsibility for his inadequacy
as a father and employer becomes a self-righteous crusader for “justice.” Regardless of
how innocent or abusive the encounter, he initiates a lifelong crusade damning tens-of-
thousands of people whose sexual encounters don’t meet his standard of propriety to a
lifetime of punishment, pain, and suffering. He continues with no acceptance of the fact that
9.0 Emotional Guidance – The Dark Side

all people, including sex offenders, have the neuroplastic capacity within their brains to change, reinterpret reality, and to recreate a beneficial new reality and quality of life for themselves and for all those around them. (ref. documentary film Untouchable: David Feige, director.)

Affective realism falsely empowers an event, person, or object with an inherent and intrinsic emotional truth or property of that event, person, or object. It is about them. It is about what they are or what they have done. It is their fault and responsibility that I feel this way (good or bad). And therefore, something must be done about them so I feel better.

Feeling good is necessary for biological health, vigor and well-being. But there is a difference in feeling better as in feeling less bad and feeling better as in feeling more good. Notice the cognitive construct of the blame game vs. the guilt complex. Blame feels better than guilt. It feels better to blame than to be guilty but they both feel bad. It feels better to blame than to admit inadequacy. It feels better to find fault within others rather than to admit one’s own personal inadequacy. It is easier to condemn and punish than to forgive and heal. One does not condemn a person who is physically broken and bleeding to a prison cell to suffer and die, yet a mind that has been abused and broken being condemned to further torture and abuse is considered just. This whole scenario is nauseating. The real crime is in society’s ignorance of not only emotional guidance training, but an understanding of the real pitfalls from lack of such training and development of emotional wisdom.

9.3.7 Cognitive and Emotional Entanglement

The infectious enthusiasm of the Grateful Red, that is, the UW student section, is spreading throughout the 80,000 spectators as the traditional end of the third quarter ‘jump around’ begins to the tune of the same name by the group ‘House of Pain’.

Similar audience enthusiasm can be found at sporting events, musical concerts, and other entertainment performances around the world. This massive infectious quality of emotions
9.0 Emotional Guidance – The Dark Side

can be found within even the smallest of interactions. It only takes two…. two on a dance floor is beautiful, but two in a suicide pack is tragic.

Cognitive and emotional entanglement is the infectious quality of thoughts, concepts and ideas to spread across a population. Fan support of their home team is fun. Mob insanity for a lynching is incomprehensible….to most of the world. The South’s enthusiastic unification into the Confederacy to defy the Unions’ usurping their righteous belief in slavery, Nazi Germany’s mass hysteria for Jewish extermination, and white America’s extermination of the Native American population shows how insidious and infectious thoughts, ideas, and beliefs may become unquestioned and acceptable patterns of thought and behavior. Again, the lack of emotional guidance training is horribly unappreciated.

Acceptance of the absurd and ridiculous may seem impossible but the brain, with its extraordinary neuroplastic adaptive abilities, makes the many socio-diverse populations possible. Inanities to one population are acceptable and unquestionable truths to another. Closed, untarnished and free from contamination by outside realities, segregated populations are free to evolve their own myths, constructs and truths….as in the conclusion that “I deserve death, simply for existing….” rationalized below:

“The church also taught me the story of Jesus, the son of God, whom God sent to earth as a defenseless human infant. Jesus spent 33 completely sinless years on this planet, only to be brutally murdered as a sacrifice for me, because of me. I was born with my sinful nature and no matter how good I try to be, how many prayers I pray or Bible study gatherings I attend, I am ultimately a sinner — and the wages of sin is death. According to the church, I deserve death, simply for existing. But the church also claims there’s good news! Even though I deserve death, Jesus’ bloody crucifixion and subsequent bodily resurrection saves me from a fiery eternal hell — all because I believe this supernatural story and earnestly accept the gift of his grace. And because of this sacrifice, I owe him a lifetime of gratitude, worship and a commitment to follow his commandments (even though, because of my human flesh, I will always ultimately fail him) (Baker, 2018, Nov. 11).”
9.0 Emotional Guidance – The Dark Side

So, the issue really isn’t the absurdity of one paradigm versus another, but what does an individual person do with what they believe:

a. Does her belief that she and others are “always an ultimate failure” contribute to a life of emotional trauma?

b. Does her belief that she deserves death turn into a belief that she and others deserve to be executed for lack of obedience to His laws?

c. Should others die because they don’t express the appropriate faith as was decided during the Spanish Inquisition, the Salem Witch Hunts, the Jewish Holocaust, or the extermination and genocide of the Indigenous populations of the two continents of the Americas?

d. Does all this belief and faith in death and deserving of death translate into a breaking point where somebody goes ‘crazy’ and burns up a church or shoots up a Synagogue?

e. Or how about “just” punishment within the judicial system of the USA including capital punishment, that ignores neuroplastic changes within the brain which offer opportunities in rehabilitation and recidivism reduction.

Hopefully, the woman quoted above has successfully navigated through the dark side of emotional realism and has retained her humanness within emotional guidance and is living a healthy, wealthy, and joyous life.

9.3.8 Core Beliefs: The Good, the Bad, and the Ugly (Vincenzoni, Leone, 1966)

The definition of a core belief can be very complex under the epistemological view called foundationalism, or a core belief can have a simple, useful definition of – commonly accepted thoughts and ideas held without question. I have done my best to outline how a commonly accepted understanding and definition, that is the core belief, of emotions has outlived its usefulness. Any discussion of emotions can and should be thought of in their simplistic sense rather than within some complex theoretical view, reserved only for a very highly educated few. Simply, there exists something commonly called emotions that we feel,
9.0 Emotional Guidance – The Dark Side

and it feels good or it feels bad. The great question is not really “how do you feel?” but “how do you want to feel?”

The flexibility of the mind, body, emotion, and consciousness relationship is confoundedly amazing to realize, as exemplified by the thousands if not millions of different societies around the thousands of years of human existence, each with their own unique beliefs, understandings, interpretations, and explanation of life’s realities. The core beliefs within a culture that are passed down through the generations can be very useful. The concept of reincarnation has allowed billions of individuals to find comfort within their difficult existence. But this same understanding of cause and effect surrounding life’s good and bad fortune can allow for the ignorance of possible, and very real, action available to individuals within their culture for their own upliftment and for the upliftment of their fellow humans.

Within another culture exists a core belief of just punishment for breaking the law. Within this discussion is a very real and complex debate of what is law and what are the grounds for its existence and what is just punishment and the grounds for its existence. These core beliefs are useful and have demonstrated great success in many cultures, but the acceptance of such beliefs have curtailed the debate of how the core belief of forgiveness can be the mainstay of a successful culture. A developing new core belief and understanding of neuroplasticity – the concept that the brain can rewire itself to accommodate new beliefs and realities – leads to a frontier of law and justice without punishment.

Justification for the domination of one people over the other, for the enslavement of a people, or even for the extermination of a people has somehow always found a foothold somewhere within the human psyche. Even today, war wages, individuals are tortured, and children are ripped away from their families in the most advanced civilization ever to exist. This same culture justifies the deaths of the 45,000 people who die annually because of lack of health care (Cecere, 2009) so the richest people in the nation can have even more wealth. As a
world, the people in power justify more wealth in exchange for the deaths of 10 million children who die yearly from lack of health care (Associated Press, 2008).

Because the brain has the capacity to rewire itself and adapt to accommodate the billions of individual families within the thousands of cultures around the world, a person can learn – and many have learned within a proper environment – to be empowered for joyous success without disempowering another’s capacity for joyous success.

*Until the illusion of emotions is understood, power will always be manipulated by those who deem their own joy and success is dependent on taking from others or from the disempowerment of others.*

### 9.4 “Reptilian” and “Mammalian” Cognitive Processors (Mind/Brain)

The “reptilian” mind is a metaphor for a very fast and reflexive cognitive neural network processor (brain/mind). Reptiles have been a very successful animal species on Earth, dominating the landscape for hundreds of millions of years, whereas modern human existence can only be thought of in tens of thousands of years and our domination of the planet in terms of a few thousand years (Kaneda, 2018).

Reptilian ethics is about an intuitive knowing with a lack of complex thought and rationale. It is reflexive and quick and where the fastest and strongest wins with a might *is* right ethical attitude. This is perfectly understandable in sports competition. And in the hierarchal structure within business and industry, quick decision making promotes inventiveness, creativity and growth. The next better idea can quickly displace an older, less profitable/functional better idea.

Mammalian ethics is a metaphor for a complex, and sophisticated cognitive mind/brain processor. Mammalian ethics is about thought and reason, a might *for* right attitude. It is not because I have the power it is right but what is right? If I have the power of deception, what is the right use of deception? If I have the power to decide, what is the right decision? Life
9.0 Emotional Guidance – The Dark Side

is not so simple: there is a vast array of ideas and meanings to life in which “what feels good is good” is a complicated ideal that needs deliberation and thought.

Again, with the lack of understanding, education, and training about emotional guidance principles, people can be subjugated and manipulated to support action against their own self-interest. It took WWII with the cost of 70-85 million lives to bring Germany out of its hypnotic stupor (Wikipedia, WW II casualties). Ideally, our government officials work for the benefit of all, not just for the favored few. Governments working to empower its citizenry to be healthy, wealthy, independent and strong feels right. Businesses’ developing, manufacturing, and producing products to empower its customers to be healthy, wealthy, independent and strong feels right. Henry Ford paid high wages so his laborers could buy his cars and all of society benefited and became wealthier. The health, wealth, independence and strength of a society is dependent on these same attributes existing within all the people living within the society: the proverbial ‘high tide lifts all boats.’

Ideally, reptilian and mammalian brains work in concert within the varying environmental demands. The great problem in our time is the reptilian control of mammalian powers. Control and deceit have become more and more sophisticated. A political discourse of lies, misinformation and deceit can be impossible to sort out. And the more lies there are, the less comprehensible is this discourse, which leads to reptilian politics based on an emotional effect of conflict and fear which weakens all of society. A mammalian inclusive, multi-agenda politics is based in a joyous and hopeful emotional effect, which strengthens and empowers all of society. For the good, the health, and the well-being of a society, it is now time to start teaching, training and educating the population about their own emotional guidance.

9.5 Out of Darkness: The Intentional Life

Emotional guidance is about coming to an internal place of emotionally feeling good. The brain/mind has such wonderful qualities of allowing. The ability of individuals to adapt into thousands of vastly different and complex cultures is astounding. But ultimately, a clash of ideals arises against society’s rules of behavior. Individual conflicts with statutory rules,
class rules, house rules, and ‘my’ rules and customs are inevitable. But maybe here, “what feels good” is good has not gone wrong.

Compassion for one’s own family members may seem natural, but stewardship of other people and beings of the planet can and should become just as natural. What need are the deaths of great whales, magnificent sharks, or ancient turtles satisfying? A rare life on this planet should be respected, glorified, and honored, not needlessly destroyed and harvested for its resources. Individual wealth and power may not necessitate a greater stewardship of others who occupy this planet, but wealth and power should not lessen one’s respect for the other beings who occupy this planet. Modern science and technology’s greatest gift to humanity is the capacity to respect the life of this planet. Might does not make right, but it does make for the capacity to contemplate what is right.

The greatness of the human life experience emerges from the flames of individual desire arising out of hell’s fiery conflicts on earth. Intention is forged in these fires. Emotional guidance aligns our journey with these new intentions. Each succeeding generation will have its own mountains to climb and waters to cross with their own stars to navigate towards. Intent is that guiding star; and it is our emotions that perceive its light. The more joyous the feeling, the more harmonious and powerful the wonders revealed through life’s journey.

10.0 Conclusion

The human spirit is intertwined within a massive collection of neural networks and circuits. Evolution has guided all these interconnecting relationships into a highly functioning being who learns and grows and strives for a joyous collaboration with his or her internal and external environment. The nature of being is to be healthy and to live a joyous life. Those who haven’t naturally grown into this wonderful connection may need help and guidance in utilizing an emotional system that has evolved to guide their cognitive universe.

Well-being begins with an appreciation and understanding of the remarkable emotional guidance circuitry found within each and every person. Those striving to become well may need the help of a psychology and psychiatry discipline that honors and promotes the emotional system as an evolved biological sensory system of the human spirit. Some people may need the help of pharmaceuticals specifically designed to help them manage their cognitive behaviors with the guidance of their emotional system. And with successful psychological rehabilitation, there is a need for a progression of less invasive medications that allow – and demand that – individuals be more responsive to their own emotional guidance.

Psychology and psychiatry can heal. They can free the mind from its bondage of past injuries and reestablish the power of consciousness to respond to its own emotional guidance in ever new, healthful and creative ways. Despair, frustration, anger, hate and depression should not serve as fuel for acts of violence, war and suicide. Instead, they should serve as a springboard of awareness for the need and priority to…. STOP …to stop the downward spiral into hell.

There is an array of neural networks associated with positive emotions, physiology and actions, a second associated with negative emotions, physiology and actions, and a third that inhibits and freezes action. The inhibitory neural network provides the circuitry to stop and

(D) Cognitive Reconstruction Between Emotions and Meditation .......... 251
The Grateful Red, the student section of the UW field house, are cheering and stomping their feet in appreciation for the skillful play of the Badgers. Team execution has reached a new level of excellence. Every shot is dropping, and for some reason, a teammate is in the right spot for every loose ball, block, rebound or steal. There is an electric current flowing. It feels good! It feels great! It is wild. This didn’t just happen. It started with an attitude, a positive attitude. It is easy to have a positive attitude when the plays are working. It takes practice to get there when it really counts, when things are going wrong and that last shot was an air ball. Especially when it is the opposing team’s court and the crowd’s taunts are echoing throughout the auditorium. That doesn’t feel very good at all.

What is a ‘positive attitude,’ or getting into ‘the zone’ or getting ‘the momentum of a game’ or getting into the ‘flow’? This mental game of ‘attitude,’ ‘the zone’ and ‘creating momentum’ is about emotions. And it is these good feeling emotions that a positive attitude is about. A positive attitude isn’t positive unless the emotions and feeling are there. The practice of positive attitude is about getting into the zone, the emotional zone, creating the emotional game first, and only then is the court yours.

Each player has their own marvelous emotional system and it is not an ‘all’ or ‘nothing’ proposition. Some players may pivot from that feeling of ‘blowing it’ to ‘isn’t this wild’ in a heartbeat; but for most it will come in steps. It may start in anger and frustration and move from there. It may start even lower, in the disempowering emotions of depression and despair. But from wherever a player is, it can and will move up into empowerment, in
steps, with a little effort. Anger is not being in the zone, but it is a step in the right direction from despair. Being frustrated that those shots are rimming out is not being in the game, but it is closer than anger. Aggressive actions taken in frustration or anger are not taken from the emotional state of being in the zone. Action here will probably result in a turn-over or foul. The results and outcomes of actions, shots, plays, follow the emotional game, not the physical attributes of the player and team. Find the right emotions first, then take the action. And with practice, moving from the despair of an “air ball” to the elation of “nothing but net” will come faster and faster, easier and easier. And then the fun really begins.

Every moment throughout every day is an opportunity to move into a better and better feeling place, to create a more powerful positive attitude. The emotional system is giving constant feedback on whether “your head” is getting into your game or into theirs. Emotions are a response to all that activity going on between the ears. They are a guidance system that lets each player individually know where their mind’s activities are heading. The better the feeling, the more the mind’s activities are in the game. The worse the feeling, the more the mind’s activities are getting lost in the opponent’s game. A time out to stop and step up the emotional staircase, from despair to anger, from anger to frustration, from frustration to hope, from hope to belief, from belief to joy, from joy to excitement, from excitement to….is a time out that means making the ball and court yours. But more than that, it means the mind, body, and heart got into the game – your game.

Practicing a positive attitude is an internal practice that doesn’t need a gym. Within every event in the day – be it with a roommate, instructor, family, driving in traffic, in a classroom or work – there is an opportunity to pivot into a better mental/emotional place, to find a more powerful positive attitude. It may start with an appreciation: an appreciation of the opponent for asking the best out of each play, shot, and defense. Each player needs to develop their own mental gymnastics to step up into a better feeling mental activity that moves them up into a better emotional state to play the game. The emotional system is there constantly, in
every moment, guiding, and letting each individual player know which direction their mind’s activities are going.

Practice off the court, so when it counts, during a game, pivoting into the zone becomes automatic. The emotional system is a constant, steady, and dependable coach that can guide the mental game so that every game can, with effort, feel like you’re in the home court. Every event throughout the day is an opportunity to practice for The Big Game and to create the air-electric. Developing mental discipline means developing the skills for listening and then responding to your emotional system (not theirs). Listening and responding to what your emotions are saying about your mental activities will get your mind back on track towards that great feeling of being unbeatable. Moving the mind’s activities – from anger to frustration, to hope, to belief, to knowing that any game on any court belongs to you – takes effort and practice. And there are hundreds of opportunities to practice every day, if you take a time out and do it. Then every game in life becomes yours and any place in the world becomes your home court. Then the air becomes filled with electricity and someone will create a spark that sets the nets on fire.

Andrew Jackson

2007-01-29
(B) Criminal Law and Justice Lagging Psychological Advancements

(rev2018-09-14e)

Criminal law is operating within an archaic knowledge and understanding of humanness. This knowledge must be updated and incorporated into any proper discussion of criminal sanctions. New advances in psychology provide new understandings of the actual harmful effects of incarceration presently deemed appropriate justice for a crime.

Understandings in the physiology of psychology and emotional psychology have not been integrated into the fundamentals of criminal sanctions and the understanding of justice. Although those who condone current practices of incarceration may defend them as proper and acceptable in modern society, I will argue that, in the absence of programs to reform incarcerated people, these practices (1) should be understood as cruel and (2) should be understood as limiting and even prohibiting the free exercise of religion.

a. ARGUMENT 1: Neuroplasticity (Jackson, 2019) is a concept supported by scientific discipline which indicates that the brain has the capacity to rewire functional areas of itself as a result of new experiences thus providing for a capacity within a being to cognitively reinterpret life experience and to reform a previous self-destructive existence.

Within the current culture of punishment and incarceration, without a reformation agenda, this natural attribute of brain physiology tends to reinforce and maintain a cognitive neural circuitry of criminal behavior. That is, the learning experience within this environment tends to accentuate the existing neural circuitry of the brain that has led to an existing criminal interpretation of life experience.
i. This reinforced criminal interpretation of reality diminishes and even prevents a person’s religious freedom to exercise a behavior within God’s favor. (reference Constitution Amendments I – free exercise of religion)

ii. Also, this reinforced criminal interpretation of reality tends to further convolute a person’s intent, rational capacity, and self-control and therefore is cruel. (reference Constitution Amendment VIII – cruel and unusual punishment shall not be inflicted)

b. ARGUMENT 2: Evolved Emotional Guidance (Jackson, 2019) redefines an evolved emotional neural circuitry as a neural circuitry of perception of the body’s biochemical physiology precipitated by the brain’s cognitive activities. This means that the neural circuitry of emotional behavior has an evolved function to guide cognitive behavior and physical activity towards the desirable aspects of life, such as, health and well-being. Emotions have naturally evolved to lead physical and cognitive behavior towards life, liberty and the pursuit of happiness.

Within the current culture of punishment and incarceration, without a reformation agenda, this natural attribute of emotions tends to reinforce and maintain an emotional neural circuitry of existing criminal behavior. That is, the learning experience within this environment tends to accentuate the existing emotional neural circuitry of the brain that has led to an existing criminal life.

i. This reinforced emotional reality of criminal behavior diminishes and even prevents a person’s religious freedom to exercise a behavior within God’s favor. (reference Constitution Amendments I – free exercise of religion)
ii. Also, this emotional reality of criminal behavior tends to further convolute a person’s intent, rational capacity, and self-control and therefore is cruel. (reference Constitution Amendment VIII – cruel and unusual punishment shall not be inflicted)

c. CONCLUSION: Neuroplasticity and Evolved Emotional Guidance redefine humanness and reconceptualize what it means to be human (Benko, 2015). These new understandings within the physiology of psychology must be incorporated to understand the nature of the actual punishment being inflicted upon a person within current incarceration as punishment practices that preclude any means of reformation.

I am arguing that a system of incarceration as punishment for a crime without any reformative processes cannot be just and is cruel because it exacerbates and reinforces the criminal element of behavior by convoluting intent, rational capacity, and self-control. This usual practice of criminal justice is a process of dehumanization and therefore is cruel. Also, a system that reinforces criminal behavior by convoluting intent, rational capacity, and self-control diminishes a person’s religious freedom to live in God’s favor, thus limiting and even prohibiting the free exercise of religion.

2

3
I was mentally insane with delusions and voices flying around my head. I was crying out for God to kill me. I blacked out and awoke with a rope in my hand to make it all end when a voice asked me, “Can you go on?” I got myself back into a mental hospital and stayed alive. I awoke in a padded cell. They doped me on medications and endlessly, minute by minute, hour by hour, day after day I spent walking the hospital halls. When released, nightly I roamed the deserts around El Paso until I ended in jail, beaten and bruised but still picking a fight with the biggest man in the cell. My wife demanded a divorce. Again, a voice wanted me to stay alive and continue my madness in hell. I said, “I can.”

The Farm:

When I was born as the number two son, my father decided to follow his mentor from college, Aldo Leopold, and raise his family on a farm. Aldo Leopold is a well-known conservationist best known for his book, Sand County Alamac. Pepper, as everyone including us kids called our Dad, helped build the cabin on the Wisconsin River featured in the book. So, to my grandparents chagrin, especially to my paternal grandfather who was a famous surgeon, my parents brought a farm. My maternal grandmother wasn’t too happy either. She was Assistant Dean of Economics at the University. But to me, the farm – with Pepper’s tutelage – became a place of continuous revelation.

I must have been two or three when we moved on to the sixty-acre homestead with the original wooden cook stove in the kitchen, a coal burning furnace in the dining room, and a two-seater outhouse for plumbing. The cook stove was replaced, and a bathroom was built upstairs, but the coal furnace always remained in the dining room. During the winter, Jack Frost covered the inside of the upstairs windows where we slept with a thick layer of leafy frost.

During these early years on the farm, I was left largely to my own devices and freely roamed around the farm with my older brother Steve, or as was most of the time, by myself. Animals
on the farm were always a source of curiosity. From the pigs we raised to Mike and Molly, the family Irish Setters and later to Bart, a German Shepherd, and Blackie, a Black Lab mix who showed up one day as a stray. Several generations of cats came and went over the years with each mother catching mice, chipmunks, and gophers to feed and to teach their kittens how to hunt. And there were raccoons, deer, wood chucks and an occasional fox.

There was a connection to the weather and the four seasons that developed because how they constantly affected daily life. Rain was not the sad metaphor of many a song, but meant life for crops. Summer thunderstorms were exciting and winter blizzards were made for play. Every spring we had hundreds of migrating geese, ducks, and even some brilliant white swans stopping in our flooded fields. A neighbor once took us into the woods to show us a newborn and spotted fawn in the brush – curled up motionless. Summer was the brilliant green and life of growing crops. Fall was the harvest and the changing leaves foreshadowing the shortened days of the coming silence of winter.

Months were not measured by a calendar, but by the seasons and the moon. Within each season, one day was much the same as another. What did change from day to day, or should I say from night to night, was the phase of the moon and its position in the sky. Each night the moon changed its shape and would have moved a little further east against the brilliantly lit up night sky amass with stars.

The indigenous people have a different and more personal relationship with the earth and sky. They are Mother Earth and Father Sky. Maybe this relationship exists because they listened and heard the voices of nature and knew and felt its presence... as I did. As I grew up and became indoctrinated within the culture of a civilized society, my worlds collided – leaving me imprisoned within the psychiatric wards and medicine of the advanced culture of modern man.

**Knock-Knock:**

His world was green, vital, and alive with tall fox tail grasses growing in the pastures and rows upon rows of corn in the fields vibrating with energy. Always barefoot, he now carefully
climbed the wire fence that held in the farm’s Black Angus cattle. His mother wanted to name him Angus, but the eventual decision was Andrew, or Andy for short. He liked those big black cows and he learned that his name, Andrew Jackson, was special.

There was a special trick to climbing a fence barefoot and he had figured it out long ago. The key was to put the wire just in the right spot on the ball of your foot. It also helped to pull with your hands, again putting the wire in an especially thick part below the fingers. Then you always climbed at a wooden fence post – not those skinny steel ones – because you had to climb high enough and put both hands on top of the post. This allowed you to take all the weight off your feet and swing them over the top of the fence. This was particularly important if there was a strand of barb wire running along the top, which, since this fence had to keep in some cattle, it did.

He was only 5 years old and the fence was very big. His efforts paid off as he was now lying on his back, oblivious of the roaming cattle, on a little rounded knoll in the back-pasture gazing at the white cotton clouds shifting and dancing across the bright blue summer’s sky. As the clouds appeared and rolled and churned within their bright blue canvas, he called out the shapes that appeared before his gaze. A dragon with his fiery breath suddenly loomed over the land. And then a mighty horse appeared, just over to the left of the dragon, running to chase it down. There were many characters in the sky but after a while he grew tired of this game and that is when he heard a voice.

“So, what do you want us to make?” he heard the clouds ask.

He thought for a moment, pondering the question. “How about a teapot?” he replied thinking nothing at all about being asked to alter the sky’s landscape. He then watched the clouds grow here, and disappeared there, and with a twist and a churn right before his eyes, he saw a teapot.

“How about a crocodile?” he exclaimed.
Again, the clouds started swirling and rolling around in no observable pattern. To any passerby, it was a warm summer’s day with white fluffy clouds passing by. But as Andy watched, he began to see a familiar shape as a crocodile appeared. It swam across the sky with its gigantic jaws seizing upon a fish.

After a while, he got up, stretched his arms and legs and walked home without a second thought about his artistic friends in the sky he had been playing with. He was hungry and looming ahead was a fence to climb and his feet were bare and a thistle may appear from nowhere. He turned his head for one last look; in the sky above his head, a Phoenix appeared with his wings spread half way across the sky.

Who’s There?

It was a dark late September night without a cloud in the sky. Pepper was on his way to do some last-minute inspection of the pig pens to make sure they were secure. Pigs were very talented and strong and were quite capable of engineering an escape when it was least expected. The stars were brilliant and the Milky Way with its light hue looked like a giant stream meandering across the landscape. Andy had decided he was going out to join Pepper on his late-night chores.

The night was cool and brisk and so Andy buttoned the top button on his green, wool Army Surplus jacket. World War II had just ended a little over ten years ago and Pepper used the extra surplus as a means to save money. Unfortunately for Mom, or Kathryn depending on the situation, these were dress jackets and she had to sew in an extra button and hole to close off the neck. Unfortunate for the three boys in the family, the wool was scratchy under the chin and the jackets were short and cut off at the waist. There was always a cold gap exposing the skin to minus twenty-degree temperatures and blowing snow in the winter.

As they walked between the barn and the tobacco shed, now laced with pig pens – growing tobacco had once been very common on these old farms – Andy stretched and looked around and found the Big Dipper through the leaves of a giant maple bordering the driveway. He
couldn’t always find the North Star, but he knew where to look. Pepper had taught all the kids how to line up the last two stars of the big dipper. The North Star was behind him and so Andy knew they were headed South. But that was just a mental exercise because he already knew how the farm laid out to the compass headings.

“Where are you going?” Andy asked his dad while trying to keep up with his long strides.

“I thought I would go out back and check out the corn.”

It was nearing the end of corn growing season. It was important for every farmer to go out into the fields and husk out an ear or two of corn to see how kind the weather was that year. A good season meant a little extra food for the animals that didn’t need to bought at the local feed store and a little extra change in the pocket. Andy was oblivious to the finances and never became privy to them until Pepper died some fifty years later.

As they stood out beside the sow house, as the last little building was named, Pepper looked up at the stars. Andy stared up with him in silence. There was something big, and huge, and mysterious going on with all those stars way up there and Earth way down here floating like a giant marble in space. It was a silent moment of reverence for some great unknown vastness.

“I wonder what is behind the stars?” he heard Pepper quietly speak as if he himself was in some mysterious place.

“Behind the stars?” Andy thought to himself. “Behind the Stars?” Then it hit him like an avalanche careening down the mountain. There was something behind the stars! He was looking up at a wall, or a ceiling, or a floor, he didn’t know what. But he could feel something beyond and behind…..the stars! It was the Universe. And… the Universe was alive.

Camelot:

My parents love of nature and for each other was passed on to us kids with our many picnics on the Wisconsin River and at Devil’s Lake, sailing with whales in the Sea of

Symbiotic Psychology: The Synergy Between Mind, Body, Emotions, and Consciousness (rev2020-01-23a)
Cortex, the many skiing trips to the mountains out west, and camping and canoe trips to the Boundary Waters and Quetico Canoe Areas. During my seventh-grade year, they built a camper and took us and our school books for three months of exploring the western national parks, two months of camping on Mexico’s Pacific shore and a month of skiing at Crested Butte, Colorado.

But my father’s fortuitous years of abundant love, joy, and the unbridled emotions of his youth were shattered with the suicidal deaths of his sisters and the brutal reality of WWII training in the Tenth Mountain Division until an ulcer put a hole in his stomach. Even the struggles, hardships, and unfamiliar challenges of his early years as a farmer lay cracks in his self-esteem as a successful scholar and academic. These emotional chasms were passed onto me by his absolute demand of obedience. The consequences of disobedience were clearly demonstrated by my witness of his demonic anger while impaling a cat with a pitchfork that mistakenly wondered into the basement of our farmhouse. The howls and screams of that skewered cat in the violent convulsive pathos of its death haunt me to this day. Beneath my father’s benevolent exterior laid a dormant volcano of unresolved nightmares ready to erupt with uncontrollable anger. Survival became dependent on knowing not my own emotional state, but his.

Mania
I was mentally-emotionally broken. My first psychotic episode was in 1979 at the age of 25. I could no longer hold my self together. I stopped…. I stopped at a stop sign. There was “evil” in the car. I stripped off my clothes, got out of the car and started running naked across a cornfield trying to align my family and the planets to make things right and to prevent further disaster. From 1979 to 1996 I was in and out of hospitals and constantly medicated. In this time, I was hospitalized maybe 10-15 times for psychotic-manic episodes and ended up on Social Security Disability.

I listened to, and tried to make work, the ideas told to me by the many therapists, psychologists, and psychiatrists in my life. It was not working for me. I could not make their...
world of mental illness, hospitals and medications my life. I was not going to be able to keep
myself alive in this hell much longer… I did not know what to do. This usually meant a
brainstorm of negative thoughts which would escalate an emotionally negative situation further
along the downward spiral. Like a run-away train down a mountain, there is not going to be a
good outcome. Or, a brainstorm of positive thoughts which would escalate a situation spiraling
upward out of control into manic wonderland. Like, Icarus flying too close to the sun, disaster
ensued.

Mania, or depression was all internally suppressed until some constraining dam broke, flooding
my life with an uncontrollable swirl of unfathomable realities. I had been trained not to
complain about aches and pains. In the cold of winter growing up on a farm, chores were to be
done. Emotions, like frost bit fingers, if there wasn’t a medical necessity and the pain could be
tolerated, keep quiet and do your job. I had broken my arm, dislocated my wrist, broken my
collarbone twice, stepped on nails that went through my foot, as well as tolerating dozens of
slivers imbedded into my hands and feet. I had learned to take my frozen hands and run them
under lukewarm water. When the severe pain stopped, they were thawed out. Pain, physical
or emotional, was a part of life. You tolerated it and kept working. Disobedience was not an
option. That is life. My emotional pain was inconsequential and to be tolerated – or so I
thought.

My hospitalizations were for psychotic-mania. My depression symptoms were ignored,
except one time around 1988 when I was in grad school for my first Master’s in Industrial
Management Technology from the UW-Stout, Menominee, WI. I told my psychiatrist that I
was having a particularly hard time in a relationship and could he give me something. A week
later, I “awoke” from another black out period. I was in a classroom with the teacher handing
back tests, including mine. I have no recollection of going to classes, taking this test or
anything else over the previous week.

Another time, after being released from the mental hospital from some psychotic-manic
episode, I was on 5-6 different medications. I really tried to keep them straight in one of those
7-day med containers, but to no avail. My mind and body were really messed up. My meds were all screwed up. The clock said 5:35 in the morning. My mind was breaking. I reeled in pain, twisting and turning for hours. I looked at the clock. It said 5:41. Six minutes had passed. I blacked out. I awoke with a rope in my hand going to hang myself. A voice asked me, “can you go on?” I said, “yes”. Somehow, I got myself back into the hospital.

My basic medications were Tegretol and Klonopin. I can’t remember the others except I was first given lithium. I quit taking it because of the side effects and ended up going psychotic. Another drug, Haloperidol, I called “the death drug” because of its horrendous side effects. If I felt I was going manic or psychotic, I would take some and “die” in pain for a day or two. The misery it caused was almost unbearable, but it kept me out of the hospital (most of the time).

Most often my ‘black out’ periods were affiliated with a manic episode. Around 1989 I “awoke” once in a hospital and wondered how I got here. The caregiver said I had gone up to a police car and told them that “my friend” needed help. “My friend” turned out to be a garbage can. During other psychotic-manic episodes I would remember events up to hospitalization and then lose a few days to blackout periods. I once “awoke” at a table in a mental hospital. The nurse gave me a pack of Camel-straights, the cigarette my mom smoked on the farm. Apparently, I now smoked and went outside with the others to have my “first” cigarette.

Another time, in 1990, I “awoke” with my mother in a drug store. Somehow, I was now in Madison, WI, 200 miles from UW-Stout where I had just finished my second master in Tech Education. We were getting my prescriptions refilled. I carefully started probing about the circumstances. I was on my way to teach industrial management in Xianyang, China. I have no idea of how many days or even weeks had gone by. Apparently, I had “lost” about 10 months of meds for my trip. We got my meds refilled and the very next day I was on my way to China.
Psychotic/manic episodes were never a “high”. When recalling a psychotic episode, I would describe them as scary, frightening, and even terrifying. I had no control. I was an observer watching somebody do crazy stuff. My reality was a “trip” that “I” participated in. It was like a “dream” ….. events just happened. An idea to do something would come to me and “I” would do it. I had lost all sense of propriety accept within some very narrow stream of psychosis. For over a decade I was in and out of hospitals, miserable, depressed, manic, psychotic and wheeling from a whole range of different emotions.

Not until the illusion of emotions is understood will the power of emotions be revealed.

High Desert Pilgrimage

Call it chance, call it luck, call it what you will…. I left my job as quality manager and followed my wife, a first-generation Chinese from Rio de Janerio, to El Paso, TX where she had gotten a “better job”. Everything kept getting worse. I was ready to die when, through the power and strength of my wife, I met 3 key healers who reintroduced me to a long, lost stranger, my joyous self.

Sharon, my new therapist, found my descriptions of my psychotic episodes hilariously funny and she created a path for me to join her in her laughter. We both had a good laugh when I described the time, I brought the police over to my friend who was in trouble and he turned out to be a garbage can. She gave me a task, “Can you find something for yourself, today, under these miserable conditions, that will make you feel a little better, make you feel a little less pain? Can you do something for yourself today? And can you do it again the next day? And the next?” From then on, I made the time to bathe in the sun’s light while floating on the water of our apartment’s swimming pool. Drifting with my face mask and snorkel, I just stared at the flickering shadows at the bottom of the pool. She had skillfully led me away from depression’s suffocating grasp and onto a path of self-empowering hope. She called it Neuro-Linguistics Programing (NLP) and Centerness Therapy. She saved my life. I call it a miracle.
Another person who taught self-empowerment through joy was Esther and her inner circle of friends called Abraham. They introduced me to the power of my inner guidance through listening to my emotions. They spoke of emotional guidance as the key to my inner strength and power and connection to my inner-being. As a cognitive-emotional cripple, I did use my emotions to guide me to a place of respect, of honor, wealth, justice and freedom.

Then I met the “Salsa Doctor,” so called because he played in a salsa band in Ciudad Juarez. Like a hamster running nowhere on a wheel in a cage, I was caught in an endless loop of being drugged when on medications and going psychotic when off medications. He actually worked with the idea that I could get better. As I gained more control of my psychotic mind through the guidance and power of my emotions, I needed less invasive medications.

It was 1992 and I was in the high deserts of El Paso, TX, when I initiated my “Program to Freedom” (in deference to Fort Bliss). I was betting my life that on a new idea that came to me. For over a decade all my psychiatrists told me I had a bio-chemical “imbalance. If I was depressed, manic, or psychotic and I had a chemical imbalance, then when I felt better would my chemical imbalance be more of a chemical in-balance? That is, in the times when I felt a little better, or actually less bad, was my biochemistry also a little better? I became my own lab-rat.

Every time I had previously stopped taking my medications, I eventually went psychotic, only to prove my doctors and parents right, that mental illness was a lifetime sentence and a lifetime of medications. I always felt they were wrong and this time I was going to prove it. I worked very hard over these next few years to change my mental-emotional state to change improve my bio-chemistry.

I started applying an idea of using my emotions to guide my behavior, especially to guide my mental behavior of what I was thinking, dreaming, imagining or even contemplating. It was obvious to me that my emotions correlated to my mental activities. I was betting that these cognitive activities also correlated with my bio-chemistry. I began to use my emotions to
guide my mental activities to improve my “bio-chemical imbalances.” If a thought brought
about an emotionally negative response, I would make attempts to “eliminate the negative.” If
a thought brought about an emotionally positive response, I would make attempts to
“accentuate the positive.” I was becoming more confident with the success of my “Program to
Freedom” and its path to my recovery.

I must admit that 1995 was not a good year. A couple of manic episodes ended up in the
mental hospital and the last one ended up in jail with my wife asking for a divorce. I
understood completely and I was very sorry I couldn’t be the person she married. That person
was alive because of the medications he took but he was also dying because of those same
drugs.

By the end of 1995 I had again stopped taking any medications though I still depended on
cigarettes to ease my turbulent mind. I was rolling my own…Bugle Boy tobacco. I couldn’t
afford the commercial variety. I started to go a “little” manic and was spending my nights
walking the desert mountains around El Paso. I emptied a 2gal coffee maker daily trying to
keep up with my mania. Eventually I came down, though with a couple more tattoos, but I was
able to stay sane enough to stay out of the hospital. That was my last manic episode. I stopped

In May of 1996 I left El Paso, TX and returned to my roots in Madison, WI. I sold my
grandmother’s prized secretary desk, which I had inherited, to pay for an airline ticket home to
Madison, WI where I had family. I shipped what few other possessions I had. My ‘ex’ drove
me to the airport and I never saw her again. I was going home to start a new life. I heard years
later that she had died of cancer. I was really pissed at her. I had gotten her citizenship and a
divorce so she would no longer be constrained by my illness. Finally, she could live the life she
deserved. She becomes free and dies….
Homeward Bound

Over the next few years back in Madison, WI I was still not in great shape but getting better. My mother helped me find an apartment and bought me a car. My father would not speak to me. I went from Social Security Disability, to packing grocery bags, to cashier, to quality inspector, to a drafting and CAD teacher in a local college. I visited a good college friend of mine. We were roommates before my nightmare into mental illness began. Our meeting was like the story of Rip Van Winkle. Mentally, it was twenty years ago and I was back in college talking to my old roommate. But he was now married, and had children in college. Tears came to my eyes as thoughts of my last twenty years flashed by, my god....... My first psychotic episode was in 1979. Because I always felt psychological and psychiatric “science” was wrong, I was on my own. I was exploring unheard of territory, a territory forbidden to me by an industry dependent on medicating mental illness and my well-meaning family who would not listen to my “insanity”. After over a decade of “their insanity”, in 1992 I began attempts to change my bio-chemical balance by correlating my emotions with my bio-chemistry. It took me four years to “regain” some semblance of mental-emotional health and well-being. After four more years of “stability”, it took several more years to stop using tobacco as a crutch. That was an acceptable transition for me.

It is now 2019; I am happily remarried, retired from mechanical engineering and living a good life...sailing with friends in the summer, football game parties in the fall, winter skiing trips with my wife and our cats to Colorado (I was once a ski instructor and daredevil doing flips and ‘helicopters’ off any little mogul) and with spring as a time of earth’s great green revival from a winter of sleep reminding me of my youth on the farm.

Plato’s Cave

I believe I can now relate to others my experiences that resulted in leaving the endless ideas, theories, paradigms and beliefs of the mental illness industry behind. I now live and believe in mental health and well-being. I work at mental health every day. Mental wellness is no longer a mystery to me and I wish to share the many ideas I used to bring my life back to the living. I
wish to explain the methods I used, and that everyone can use to improve their mental and
emotional well-being.

For the past fifteen years I have been working on a paper explaining my return to well-being. I
have written and re-written this paper 100’s of times. These ideas have now evolved into a
psychology of their own…. Symbiotic Psychology. The book is “Symbiotic Psychology: The
Synergy Between Mind, Body, Emotions and Consciousness” and presents a scientific
argument and logic identifying where the mental health academia has gone wrong.

There is a correlative relationship between cognition, emotions, and biology, but instead of
emotions changing the body’s biology as modern psychological theory professes, emotions are
a sensory awareness of the biological states/changed precipitated by cognitive activities. The
world that erupts with this paradigm change presents an idea of self-empowerment where
anyone, with diligent awareness to their own emotional guidance, can better their lives with
greater mental and physical health, well-being, and prosperity. And for the
cognitive/emotionally injured, there is a path out of hell to a life of wellness and well-being
free from doctors, therapists and medications. The book is laid out as a website for anyone to
use on https://symbioticpsychology.com/ where the book can also be downloaded as a PDF.

Over the last year, I sent emails to over 18,000 individuals within the university academia
around the world explaining the flaws and dangers of current psychological emotional theory.
They have yet to understand; one day they will hear.

Do not fixate on the broken and mangled hand, for it is indeed a soreness to any beholder.
The message is not within the hand, nor within the moon and stars at which it points but
lies within another Universe that surrounds us – known only through its quiet revelations

(D) A Cognitive Reconstruction Between Emotions and Meditation

(rev2018-11-30)

The illusion of emotions is to believe that destructive and aberrant emotions are driving mental activities instead of emotions being a reflection of destructive and aberrant cognitive behavior. It is cognitive behavior that is accessible for consciousness to act upon and modify.

The meditation discipline and training of Tibetan Monks and Lamas provide them insights incomprehensible to the ordinary person. But only those who have the opportunity, time, and resources to commit to their enlightening meditative methods can have access to Tibetan Buddhism’s vast depth of knowing. There are millions of others around this Earth who, as yet, do not have the inner drive, strength, and power to obtain the knowledge and wisdom associated with thousands of hours of meditation. But they can take a step closer. Humanity has the internal wisdom to take another step out of their ignorance.

I wish to speak of meditation, contemplation and other cognitive acts of knowing and I wish to speak of these mental activities’ relationships to emotions and the body. I wish to develop and extend the definition and understanding of emotions into a concept that appreciates the existence of emotions. Emotions have a common definition within the mass consciousness. The time has come to change this definition that has been used for millennia. Mass consciousness is ready for a more accurate understanding of the relationship between mind, body, and emotions.

If a meditative activity results in negative emotions, are not emotions providing insights into the effectiveness, or ineffectiveness, of the meditation? Are not the emotions of peace and joy the indications of a successful contemplation of knowledge? Do not emotions aid in the understanding of the effectiveness, or ineffectiveness, of meditations and contemplations? If a meditator experiences negative and destructive emotion, are not these emotions indications of ignorance? Emotions used in a manner which provides insights are constructive because
emotions are providing valuable information on the effectiveness of the meditation and contemplation practices.

Therefore, who cannot use their own emotions to understand the effectiveness and validity of their own mental processes? Tibetan Monks and Lamas can realize the success or failure of their meditative and contemplative practices by acknowledging the presence of associated emotions. Any ordinary person may also use their own emotions to realize the nature of their own mental and cognitive processes. Emotions that feel negative indicate thoughts and cognition that is deviating away from a person’s intentions. Emotions that feel good are indications of a mind in harmony with a person’s intent. Thus, a key to fulfillment is to use the feedback emotions provide on the quality of mental processes and whether those mental processes are meeting a person’s intentions.

Modern science has the tools to clearly demonstrate that (a) cognitive activities stimulate (b) various areas of the brain. These stimulated cognitive areas, in turn, send signals to (c) other areas of the brain which activate biochemical events that change (d) the biochemistry throughout the body. It is these biochemical changes that are then perceived. We call these perceptions… (e) emotions.

Cognition (a) causes biochemical activity (d) that we perceive as emotions (e). The emotions that we feel (e) are the result of cognitive activities (a), not the cause of them. The illusion of emotions is that emotions drive the mind. Humanity is ready to accept the understanding that emotions do not precede cognition. Cognition, or the mental acts of knowing, come first. Even if emotions are first realized before any mental activity is acknowledged and it seems as if emotions are driving thoughts and activities, this is not the case. Failure to recognize cognitive activity before emotional activity only indicates the lack of attention being given to the thoughts and ideas being generated within the mind.

Therefore, as the mind can have destructive and aberrant cognitive activities, it is the resultant emotions which are giving their creator key knowledge, understandings, and insight into these...
mental activities. Negative, destructive, and aberrant emotions are precipitated by the
cognitive activity of the mind. The illusion of emotions is to believe that destructive and
aberrant emotions are driving mental activities instead of emotions being a reflection of
destructive and aberrant cognitive behavior which is accessible for consciousness to act upon
and modify. The extreme power and value of emotions to the individual is that emotions
clearly broadcast to the individual a previously unrecognized aspect of their own cognitive
activities.

Using emotions to evaluate cognitive processes is the bridge from ignorance to enlightenment
for those who do not have the internal nor external resources for thousands of hours of
meditative practices. Emotional guidance can be used in the mundane activities of daily life by
anyone who wishes to lead an intentional life. Tibetan monks are using emotional guidance. I
am only reshaping the concept towards a more general application that anyone can, and should,
learn and use.

Mass consciousness and academia currently believes in the cognitive construct of destructive
and aberrant emotions. I have reasoned above how this illusionary nature of emotions, though
commonly accepted and professed, is in error. Not until this illusionary construct of emotions
is reconstructed, will the power of emotions be available for humanity’s self-empowerment.

The full argument: Symbiotic Psychology: The Synergy Between Mind, Body, Emotions and
Consciousness will be found on http://emotional-evolution.com/.

Andrew Jackson
2018-11-28
I was mentally insane with delusions and voices flying around my head. I was crying out for God to kill me. I blacked out and awoke with a rope in my hand to make it all end when a voice asked me, “Can you go on?” I got myself back into a mental hospital and stayed alive. I awoke in a padded cell. They doped me on medications and endlessly, minute by minute, hour by hour, day after day I spent walking the hospital halls. When released, nightly I roamed the deserts around El Paso until I ended in jail, beaten and bruised but still picking a fight with the biggest man in the cell. My wife demanded a divorce. Again, a voice wanted me to stay alive and continue my madness in hell. I said, “I can.”
Emotions Cannot Be Both the Cause of Neurological and Biological Changes Within the Brain and Body and the Effect of Said Same Neurology and Biology

Emotions as used in science are both causal to biological change and the effect of biological change. This is not science. One word, emotions, cannot be defined as both the cause of neurological and biological change and the perceptual awareness of said same neurological and biological change. Symbiotic Psychology defines emotions as a perceived effect of neurological and biological changes precipitated by cognitive processing activities of the mind.

Since I began voicing my concerns over psychological and pharmaceutical therapeutic methodologies erroneously based within causal aberrant and destructive emotions, over a million (MILLION) Americans have committed suicide, millions of other people have been put in incarcerating conditions that only amplify their psychological injuries, and mass shootings continue with no review of the psychological environments that are oblivious to emotions’ evolutionary design and that are fostering all of these atrocities. Lack of true academic questioning and review of psychological and pharmaceutical emotional theory is a true crime against humanity.

“The science” of emotional regulation kept me imprisoned in a living hell.

My psychologist gave me a life sentence: psychotic mania of bizarre realities, listening to voices, and a split personality with blackout periods when someone else was at the helm. And then there was the suicidal depression. I ‘awoke’ with a rope in my hand when a voice asked, “Can you go on?” I said, “Yes,” and got myself to the mental hospital.

“The logic” of cognitive regulation through emotional guidance set me free.

Rather than demonizing emotions as aberrant, destructive, out-of-control and in need of regulation because of an emotional disorder, Symbiotic Psychology understands emotions as an evolved sensory system, akin to the sense of pain, giving conscious feedback of a state of biochemical physiology. Emotions, instead of being regulated by cognitive behavior, are used to guide cognitive behavior for the health, well-being, and prosperity of the individual.
